

# ProASIC3L Low Power Flash FPGAs with Flash\*Freeze Technology

## Features and Benefits

### Low Power

- Dramatic Reduction in Dynamic and Static Power Savings
- 1.2 V to 1.5 V Core and I/O Voltage Support for Low Power
- Low Power Consumption in Flash\*Freeze Mode Allows for Instantaneous Entry to / Exit from Low-Power Flash\*Freeze Mode
- Supports Single-Voltage System Operation
- Low-Impedance Switches

### High Capacity

- 250,000 to 3,000,000 System Gates
- Up to 504 kbits of True Dual-Port SRAM
- Up to 620 User I/Os

### Reprogrammable Flash Technology

- 130-nm, 7-Layer Metal (6 Copper), Flash-Based CMOS Process
- Instant On Level 0 Support
- Single-Chip Solution
- Retains Programmed Design when Powered Off

### High Performance

- 350 MHz (1.5 V systems) and 250 MHz (1.2 V systems) System Performance
- 3.3 V, 66 MHz, 66-Bit PCI (1.5 V systems) and 66 MHz, 32-Bit PCI (1.2 V systems)

### In-System Programming (ISP) and Security

- ISP Using On-Chip 128-Bit Advanced Encryption Standard (AES) Decryption via JTAG (IEEE 1532-compliant)
- FlashLock® to Secure FPGA Contents

### High-Performance Routing Hierarchy

- Segmented, Hierarchical Routing and Clock Structure
- High-Performance, Low-Skew Global Network
- Architecture Supports Ultra-High Utilization

### Advanced and Pro (Professional) I/Os

- 700 Mbps DDR, LVDS-Capable I/Os
- 1.2 V, 1.5 V, 1.8 V, 2.5 V, and 3.3 V Mixed-Voltage Operation
- Bank-Selectable I/O Voltages—up to 8 Banks per Chip

- Single-Ended I/O Standards: LVTTTL, LVCMOS 3.3 V / 2.5 V / 1.8 V / 1.5 V / 1.2 V, 3.3 V PCI / 3.3 V PCI-X, and LVCMOS 2.5 V / 5.0 V Input
- Differential I/O Standards: LVPECL, LVDS, B-LVDS, and M-LVDS
- Voltage-Referenced I/O Standards: GTL+ 2.5 V / 3.3 V, GTL 2.5 V / 3.3 V, HSTL Class I and II, SSTL2 Class I and II, SSTL3 Class I and II (A3PE3000L only)
- Wide Range Power Supply Voltage Support per JESD8-B, Allowing I/Os to Operate from 2.7 V to 3.6 V
- Wide Range Power Supply Voltage Support per JESD8-12, Allowing I/Os to Operate from 1.14 V to 1.575 V
- I/O Registers on Input, Output, and Enable Paths
- Hot-Swappable and Cold-Sparing I/Os Programmable Output Slew Rate and Drive Strength
- Programmable Input Delay (A3PE3000L only)
- Schmitt Trigger Option on Single-Ended Inputs (A3PE3000L)
- Weak Pull-Up/Down
- IEEE 1149.1 (JTAG) Boundary Scan Test
- Pin-Compatible Packages across the ProASIC®3L Family (except PQ208)

### Clock Conditioning Circuit (CCC) and PLL

- Six CCC Blocks, One with Integrated PLL (ProASIC3L) and All with Integrated PLL (ProASIC3EL)
- Configurable Phase Shift, Multiply/Divide, Delay Capabilities, and External Feedback
- Wide Input Frequency Range 1.5 MHz to 250 MHz (1.2 V systems) and 350 MHz (1.5 V systems)

### SRAMs and FIFOs

- Variable-Aspect-Ratio 4,608-Bit RAM Blocks (×1, ×2, ×4, ×9, and ×18 organizations available)
- True Dual-Port SRAM (except ×18)
- 24 SRAM and FIFO Configurations with Synchronous Operation:
  - 250 MHz: For 1.2 V systems
  - 350 MHz: For 1.5 V systems

### ARM® Processor Support in ProASIC3L FPGAs

- ARM Cortex™-M1 Soft Processor Available with or without Debug

**Table 1 • ProASIC3 Low-Power Product Family**

| ProASIC3L Devices                   | A3P250L      | A3P600L             | A3P1000L            | A3PE3000L           |
|-------------------------------------|--------------|---------------------|---------------------|---------------------|

| FBGA                                | FG144, FG256 | FG144, FG256, FG484 | FG144, FG256, FG484 | FG324, FG484, FG896 |

#### Notes:

1. Refer to the [Cortex-M1 product brief](#) for more information.
2. AES is not available for ARM Cortex-M1 ProASIC3L devices.
3. For the A3PE3000L, the PQ208 package has six CCCs and two PLLs.

| FG324                             | –                                 | –                         | –                                 | –                         | –                                 | –                         | 221                               | 110                       |
| FG484                             | –                                 | –                         | 235                               | 60                        | 300                               | 74                        | 341                               | 168                       |
| FG896                             | –                                 | –                         | –                                 | –                         | –                                 | –                         | 620                               | 310                       |

### Notes:

1. When considering migrating your design to a lower- or higher-density device, refer to the packaging section of the datasheet to ensure you are complying with design and board migration requirements.
2. For A3P250L devices, the maximum number of LVPECL pairs in east and west banks cannot exceed 15.
3. ARM Cortex-M1 support is TBD on this device.
4. Each used differential I/O pair reduces the number of single-ended I/Os available by two.
5. FG256 and FG484 are footprint-compatible packages.
6. "G" indicates RoHS-compliant packages. Refer to "ProASIC3L Ordering Information" on page III for the location of the "G" in the part number.
7. For A3PE3000L devices, the usage of certain I/O standards is limited as follows:
  - SSTL3(I) and (II): up to 40 I/Os per north or south bank
  - LVPECL / GTL+ 3.3 V / GTL 3.3 V: up to 48 I/Os per north or south bank
  - SSTL2(I) and (II) / GTL+ 2.5 V / GTL 2.5 V: up to 72 I/Os per north or south bank
8. When the Flash\*Freeze pin is used to directly enable Flash\*Freeze mode and not as a regular I/O, the number of single-ended user I/Os available is reduced by one.

**Table 2 • ProASIC3L FPGAs Package Sizes Dimensions**

| Package                         | VQ100   | PQ208   | FG144   | FG256   | FG324   | FG484   | FG896   |
|---------------------------------|---------|---------|---------|---------|---------|---------|---------|
| Length × Width (mm\mm)          | 14 × 14 | 28 × 28 | 13 × 13 | 17 × 17 | 19 × 19 | 23 × 23 | 31 × 31 |
| Nominal Area (mm <sup>2</sup> ) | 196     | 784     | 169     | 289     | 361     | 529     | 961     |
| Pitch (mm)                      | 0.5     | 0.5     | 1.0     | 1.0     | 1.0     | 1.0     | 1.0     |
| Height (mm)                     | 1.00    | 3.40    | 1.45    | 1.60    | 1.63    | 2.23    | 2.23    |

## ProASIC3L Ordering Information

### ProASIC3L Devices

A3P250L = 250,000 System Gates  
 A3P600L = 600,000 System Gates  
 A3P1000L = 1,000,000 System Gates  
 A3PE3000L = 3,000,000 System Gates

### ProASIC3L Devices with Cortex-M1

M1A3P600L = 600,000 System Gates  
 M1A3P1000L = 1,000,000 System Gates  
 M1A3PE3000L = 3,000,000 System Gates

## Temperature Grade Offerings

| Package               | A3P250L | A3P600L   | A3P1000L   | A3PE3000L   |
|-----------------------|---------|-----------|------------|-------------|
| ARM Cortex-M1 Devices |         | M1A3P600L | M1A3P1000L | M1A3PE3000L |
| VQ100                 | C, I    | –         | –          |             |
| PQ208                 | C, I    | C, I      | C, I       | C, I        |
| FG144                 | C, I    | C, I      | C, I       |             |
| FG256                 | C, I    | C, I      | C, I       |             |
| FG324                 | –       | –         | –          | C, I        |
| FG484                 | –       | C, I      | C, I       | C, I        |
| FG896                 | –       | –         | –          | C, I        |

**Notes:**

1. C = Commercial temperature range: 0°C to 70°C ambient temperature.
2. I = Industrial temperature range: –40°C to 85°C ambient temperature.

## Speed Grade and Temperature Grade Matrix

| Temperature Grade | Std. | –1 |
|-------------------|------|----|
| C <sup>1</sup>    | 3    | 3  |
| I <sup>2</sup>    | 3    | 3  |

**Notes:**

1. C = Commercial temperature range: 0°C to 70°C ambient temperature.
2. I = Industrial temperature range: –40°C to 85°C ambient temperature.

## ProASIC3L Device Status

| ProASIC3L Devices | Status     | M1 ProASIC3L Devices | Status     |
|-------------------|------------|----------------------|------------|
| A3P250L           | Production |                      |            |
| A3P600L           | Production | M1A3P600L            | Production |
| A3P1000L          | Production | M1A3P1000L           | Production |
| A3P3000L          | Production | M1A3P3000L           | Production |

# 1 – ProASIC3L Device Family Overview

---

## General Description

The ProASIC3L family of Microsemi flash FPGAs dramatically reduces dynamic power consumption by 40% and static power by 50% compared to the equivalent ProASIC3 device. These power savings are coupled with performance, density, true single-chip, 1.2 V to 1.5 V core and I/O operation as low as 1.2 V, reprogrammability, and advanced features.

Using Microsemi's proven Flash\*Freeze technology enables users to shut off dynamic power instantaneously and switch the device to static mode without the need to switch off clocks or power supplies while retaining internal states of the device. This greatly simplifies power management on a board done through I/Os and clocks. In addition, optimized software tools using power-driven layout provide instant push-button power reduction.

Nonvolatile flash technology gives ProASIC3L devices the advantage of being a secure, low-power, single-chip solution that is Instant On. ProASIC3L offers dramatic dynamic power savings giving the FPGA users flexibility to combine low power with high performance.

These features enable designers to create high-density systems using existing ASIC or FPGA design flows and tools.

ProASIC3L devices offer 1 kbit of on-chip, reprogrammable, nonvolatile FlashROM storage as well as clock conditioning circuitry (CCC) based on an integrated phase-locked loop (PLL). ProASIC3L devices support devices from 250 k system gates to 3 million system gates with up to 504 kbits of true dual-port SRAM and 620 user I/Os.

M1 ProASIC3L devices support the high-performance, 32-bit Cortex-M1 processor developed by ARM for implementation in FPGAs. ARM Cortex-M1 is a soft processor that is fully implemented in the FPGA fabric. It has a three-stage pipeline that offers a good balance between low-power consumption and speed when implemented in an M1 ProASIC3L device. The processor runs the ARMv6-M instruction set, has a configurable nested interrupt controller, and can be implemented with or without the debug block. ARM Cortex-M1 is available for free from Microsemi for use in M1 ProASIC3L FPGAs.

The ARM-enabled devices have Microsemi SoC Products Group ordering numbers that begin with M1 and do not support AES decryption.

## Flash\*Freeze Technology

The ProASIC3L devices offer Microsemi's proven Flash\*Freeze technology, which allows instantaneous switching from an active state to a static state. ProASIC3L devices do not need additional components to turn off I/Os or clocks while retaining the design information, SRAM content, and registers. Flash\*Freeze technology is combined with in-system programmability, which enables users to quickly and easily upgrade and update their designs in the final stages of manufacturing or in the field. The ability of ProASIC3L devices to support a wide range core voltage (1.2 V to 1.5 V) allows for an even greater reduction in power consumption, which enables low total system power.

When the ProASIC3L device enters Flash\*Freeze mode, the device automatically shuts off the clocks and inputs to the FPGA core; when the device exits Flash\*Freeze mode, all activity resumes and data is retained.

The availability of low-power modes, combined with a reprogrammable, single-chip, single-voltage solution, make ProASIC3L devices suitable for low-power data transfer and manipulation in portable media, secure communications, radio applications as well as high performance portable, industrial, test, scientific, and medical applications.

## Flash Advantages

### Low Power

The ProASIC3L family of Microsemi flash-based FPGAs provide a low-power advantage, and when coupled with high performance, enables designers to make power-smart choices using a single-chip, reprogrammable, and Instant On device.

ProASIC3L devices offer 40% dynamic power and 50% static power savings compared to the equivalent ProASIC3 device by reducing the core operating voltage to 1.2 V. In addition, the Power Driven Layout (PDL) feature in Libero® System-on-Chip (SoC) offers up to 30% additional power reduction over the standard timing-driven place-and-route (TDPR). With Flash\*Freeze technology, ProASIC3L devices are able to retain device SRAM and logic while dynamic power is reduced to a minimum, without the need to stop clock or power supplies. Combining these features provides a low-power, feature-rich and high-performance solution.

### Security

Nonvolatile, flash-based ProASIC3L devices do not require a boot PROM, so there is no vulnerable external bitstream that can be easily copied. ProASIC3L devices incorporate FlashLock, which provides a unique combination of reprogrammability and design security without external overhead, advantages that only an FPGA with nonvolatile flash programming can offer.

ProASIC3L devices utilize a 128-bit flash-based lock and a separate AES key to provide the highest level of protection in the FPGA industry for programmed intellectual property and configuration data. In addition, all FlashROM data in ProASIC3L devices can be encrypted prior to loading, using the industry-leading AES-128 (FIPS192) bit block cipher encryption standard. AES was adopted by the National Institute of Standards and Technology (NIST) in 2000 and replaces the 1977 DES standard. ProASIC3L devices have a built-in AES decryption engine and a flash-based AES key that make them the most comprehensive programmable logic device security solution available today. ProASIC3L devices with AES-based security provide a high level of protection for remote field updates over public networks such as the Internet, and are designed to ensure that valuable IP remains out of the hands of system overbuilders, system cloners, and IP thieves.

Security, built into the FPGA fabric, is an inherent component of the ProASIC3L family. The flash cells are located beneath seven metal layers, and many device design and layout techniques have been used to make invasive attacks extremely difficult. The ProASIC3L family, with FlashLock and AES security, is unique in being highly resistant to both invasive and noninvasive attacks. Your valuable IP is protected with industry-standard security, making remote ISP possible. A ProASIC3L device provides the best available security for programmable logic designs.

### Single Chip

Flash-based FPGAs store their configuration information in on-chip flash cells. Once programmed, the configuration data is an inherent part of the FPGA structure, and no external configuration data needs to be loaded at system power-up (unlike SRAM-based FPGAs). Therefore, flash-based ProASIC3L FPGAs do not require system configuration components such as EEPROMs or microcontrollers to load device configuration data. This reduces bill-of-materials costs and PCB area, and increases security and system reliability.

### Instant On

Flash-based ProASIC3L devices support Level 0 of the Instant On classification standard. This feature helps in system component initialization, execution of critical tasks before the processor wakes up, setup and configuration of memory blocks, clock generation, and bus activity management. The Instant On feature of flash-based ProASIC3L devices greatly simplifies total system design and reduces total system cost, often eliminating the need for CPLDs and clock generation PLLs. In addition, glitches and brownouts in system power will not corrupt the ProASIC3L device's flash configuration, and unlike SRAM-based FPGAs, the device will not have to be reloaded when system power is restored. This enables the reduction or complete removal of the configuration PROM, expensive voltage monitor, brownout detection, and clock generator devices from the PCB design. Flash-based ProASIC3L devices simplify total system design and reduce cost and design risk while increasing system reliability and improving system initialization time.

## **Reduced Cost of Ownership**

Advantages to the designer extend beyond low unit cost, performance, and ease of use. Unlike SRAM-based FPGAs, flash-based ProASIC3L devices allow all functionality to be Instant On; no external boot PROM is required. On-board security mechanisms prevent access to all the programming information and enable secure remote updates of the FPGA logic. Designers can perform secure remote in-system reprogramming to support future design iterations and field upgrades with confidence that valuable intellectual property cannot be compromised or copied. Secure ISP can be performed using the industry-standard AES algorithm. The ProASIC3L family device architecture mitigates the need for ASIC migration at higher user volumes. This makes the ProASIC3L family a cost-effective ASIC replacement solution, manipulation in portable media and secure communications, radio applications as well as high performance portable Industrial, test, scientific and medical applications.

## **Firm-Error Immunity**

Firm errors occur most commonly when high-energy neutrons, generated in the upper atmosphere, strike a configuration cell of an SRAM FPGA. The energy of the collision can change the state of the configuration cell and thus change the logic, routing, or I/O behavior in an unpredictable way. These errors are impossible to prevent in SRAM FPGAs. The consequence of this type of error can be a complete system failure. Firm errors do not exist in the configuration memory of ProASIC3L flash-based FPGAs. Once it is programmed, the flash cell configuration element of ProASIC3L FPGAs cannot be altered by high-energy neutrons and is therefore immune to them. Recoverable (or soft) errors occur in the user data SRAM of all FPGA devices. These can easily be mitigated by using error detection and correction (EDAC) circuitry built into the FPGA fabric.

## **Advanced Flash Technology**

The ProASIC3L family offers many benefits, including nonvolatility and reprogrammability, through an advanced flash-based, 130-nm LVC MOS process with 7 layers of metal. Standard CMOS design techniques are used to implement logic and control functions. The combination of fine granularity, enhanced flexible routing resources, and abundant flash switches allows for very high logic utilization without compromising device routability or performance. Logic functions within the device are interconnected through a four-level routing hierarchy.

## **Advanced Architecture**

The proprietary ProASIC3L architecture provides granularity comparable to standard-cell ASICs. The ProASIC3L device consists of five distinct and programmable architectural features ([Figure 1-1 on page 1-4](#) and [Figure 1-2 on page 1-4](#)):

- FPGA VersaTiles
- Dedicated FlashROM
- Dedicated SRAM/FIFO memory
- Extensive CCCs and PLLs
- I/O structure

The FPGA core consists of a sea of VersaTiles. Each VersaTile can be configured as a three-input logic function, a D-flip-flop (with or without enable), or a latch by programming the appropriate flash switch interconnections. The versatility of the ProASIC3L core tile, as either a three-input lookup table (LUT) equivalent or a D-flip-flop/latch with enable, allows for efficient use of the FPGA fabric.

The VersaTile capability is unique to the ProASIC family of third-generation-architecture flash FPGAs. VersaTiles are connected with any of the four levels of routing hierarchy. Flash switches are distributed throughout the device to provide nonvolatile, reconfigurable interconnect programming. Maximum core utilization is possible for virtually any design.

**Figure 1-1 • ProASIC3L Device Architecture Overview with Four I/O Banks (A3P250L, A3P600L, and A3P1000L)**

**Figure 1-2 • ProASIC3EL Device Architecture Overview**

## Flash\*Freeze Technology

The ProASIC3L devices offer Microsemi's proven Flash\*Freeze technology, which enables designers to instantaneously shut off dynamic power consumption while retaining all SRAM and register information. Flash\*Freeze technology enables the user to quickly (within 1  $\mu$ s) enter and exit Flash\*Freeze mode by activating the Flash\*Freeze (FF) pin while all power supplies are kept at their original values. In addition, I/Os and global I/Os can still be driven and can be toggling without impact on power consumption; clocks can still be driven or can be toggling without impact on power consumption; and the device retains all core registers, SRAM information, and states. I/O states are tristated during Flash\*Freeze mode or can be set to a certain state using weak pull-up or pull-down I/O attribute configuration. No power is consumed by the I/O banks, clocks, JTAG pins, or PLL. Flash\*Freeze technology allows the user to switch to active mode on demand, thus simplifying the power management of the device.

The FF pin (active low) can be routed internally to the core to allow the user's logic to decide when it is safe to transition to this mode. It is also possible to use the FF pin as a regular I/O if Flash\*Freeze mode usage is not planned, which is advantageous because of the inherent low-power static and dynamic capabilities of the ProASIC3L device. Refer to [Figure 1-3](#) for an illustration of entering/exiting Flash\*Freeze mode.

**Figure 1-3 • ProASIC3L Flash\*Freeze Mode**

## VersaTiles

The ProASIC3L core consists of VersaTiles, which have been enhanced beyond the ProASIC<sup>PLUS</sup>® core tiles. The ProASIC3L VersaTile supports the following:

- All 3-input logic functions—LUT-3 equivalent
- Latch with clear or set
- D-flip-flop with clear or set
- Enable D-flip-flop with clear or set

Refer to [Figure 1-4](#) for VersaTile configurations.

**Figure 1-4 • VersaTile Configurations**

## **User Nonvolatile FlashROM**

ProASIC3L devices have 1 kbit of on-chip, user-accessible, nonvolatile FlashROM. The FlashROM can be used in diverse system applications:

- Internet Protocol addressing (wireless or fixed)
- System calibration settings
- Device serialization and/or inventory control
- Subscription-based business models (for example, set-top boxes)
- Secure key storage for secure communications algorithms
- Asset management/tracking
- Date stamping
- Version management

The FlashROM is written using the standard ProASIC3L IEEE 1532 JTAG programming interface. The core can be individually programmed (erased and written), and on-chip AES decryption can be used selectively to securely load data over public networks, as in security keys stored in the FlashROM for a user design.

The FlashROM can be programmed via the JTAG programming interface, and its contents can be read back either through the JTAG programming interface or via direct FPGA core addressing. Note that the FlashROM can only be programmed from the JTAG interface and cannot be programmed from the internal logic array.

The FlashROM is programmed as 8 banks of 128 bits; however, reading is performed on a byte-by-byte basis using a synchronous interface. A 7-bit address from the FPGA core defines which of the 8 banks and which of the 16 bytes within that bank are being read. The three most significant bits (MSBs) of the FlashROM address determine the bank, and the four least significant bits (LSBs) of the FlashROM address define the byte.

The ProASIC3L development software solutions, Libero SoC and Designer, have extensive support for the FlashROM. One such feature is auto-generation of sequential programming files for applications requiring a unique serial number in each part. Another feature allows the inclusion of static data for system version control. Data for the FlashROM can be generated quickly and easily using Libero SoC and Designer software tools. Comprehensive programming file support is also included to allow for easy programming of large numbers of parts with differing FlashROM contents.

## **SRAM and FIFO**

ProASIC3L devices have embedded SRAM blocks along their north and south sides. Each variable-aspect-ratio SRAM block is 4,608 bits in size. Available memory configurations are 256×18, 512×9, 1k×4, 2k×2, and 4k×1 bits. The individual blocks have independent read and write ports that can be configured with different bit widths on each port. For example, data can be sent through a 4-bit port and read as a single bitstream. The embedded SRAM blocks can be initialized via the device JTAG port (ROM emulation mode) using the UJTAG macro.

In addition, every SRAM block has an embedded FIFO control unit. The control unit allows the SRAM block to be configured as a synchronous FIFO without using additional core VersaTiles. The FIFO width and depth are programmable. The FIFO also features programmable Almost Empty (AEMPTY) and Almost Full (AFULL) flags in addition to the normal Empty and Full flags. The embedded FIFO control unit contains the counters necessary for generation of the read and write address pointers. The embedded SRAM/FIFO blocks can be cascaded to create larger configurations.

## **PLL and CCC**

ProASIC3L devices provide designers with flexible clock conditioning circuit (CCC) capabilities. Each member of the ProASIC3L family contains six CCCs. One CCC (center west side) has a PLL.

The six CCC blocks are located at the four corners and the centers of the east and west sides. One CCC (center west side) has a PLL.

All six CCC blocks are usable; the four corner CCCs and the east CCC allow simple clock delay operations as well as clock spine access.

The inputs of the six CCC blocks are accessible from the FPGA core or from one of several inputs located near the CCC that have dedicated connections to the CCC block.

The CCC block has these key features:

- Wide input frequency range ( $f_{IN\_CCC}$ ) = 1.5 MHz up to 250 MHz
- Output frequency range ( $f_{OUT\_CCC}$ ) = 0.75 MHz up to 250 MHz
- 2 programmable delay types for clock skew minimization
- Clock frequency synthesis

Additional CCC specifications:

- Internal phase shift = 0°, 90°, 180°, and 270°. Output phase shift depends on the output divider configuration.
- Output duty cycle = 50%  $\pm$  1.5% or better
- Low output jitter: worst case < 2.5%  $\times$  clock period peak-to-peak period jitter when single global network used
- Maximum acquisition time is 300  $\mu$ s
- Exceptional tolerance to input period jitter—allowable input jitter is up to 1.5 ns
- Four precise phases; maximum misalignment between adjacent phases of 40 ps  $\times$  250 MHz /  $f_{OUT\_CCC}$

## Global Clocking

ProASIC3L devices have extensive support for multiple clocking domains. In addition to the CCC and PLL support described above, there is a comprehensive global clock distribution network.

Each VersaTile input and output port has access to nine VersaNets: six chip (main) and three quadrant global networks. The VersaNets can be driven by the CCC or directly accessed from the core via multiplexers (MUXes). The VersaNets can be used to distribute low-skew clock signals or for rapid distribution of high-fanout nets.

## I/Os with Advanced I/O Standards

The ProASIC3L family of FPGAs features a flexible I/O structure, supporting a range of voltages (1.2 V, 1.5 V, 1.8 V, 2.5 V, 3.0 V wide range, and 3.3 V). ProASIC3L FPGAs support different I/O standards, including single-ended, differential, and voltage-referenced (ProASIC3EL only). The I/Os are organized into banks, with two, four, or eight (ProASIC3EL only) banks per device. The configuration of these banks determines the I/O standards supported (Table 1-1). For ProASIC3EL, each I/O bank is subdivided into VREF minibanks, which are used by voltage-referenced I/Os. VREF minibanks contain 8 to 18 I/Os. All the I/Os in a given minibank share a common VREF line. Therefore, if any I/O in a given VREF minibank is configured as a VREF pin, the remaining I/Os in that minibank will be able to use that reference voltage.

**Table 1-1 • I/O Standards Supported**

| I/O Bank Type | Device and Bank Location   | I/O Standards Supported |            |                              |                                                                                  |
|---------------|----------------------------|-------------------------|------------|------------------------------|----------------------------------------------------------------------------------|
|               |                            | LVTTL/ LVCMOS           | PCI/ PCI-X | LVPECL, LVDS, B-LVDS, M-LVDS | GTL+ 2.5 V/3.3 V, GTL 2.5 V/3.3 V, HSTL I and II, SSTL2 I and II, SSTL3 I and II |
| Pro I/Os      | A3PE3000L                  | 3                       | 3          | 3                            | 3                                                                                |
| Advanced I/Os | A3P250L, A3P600L, A3P1000L | 3                       | 3          | 3                            | Not supported                                                                    |

Each I/O module contains several input, output, and enable registers. These registers allow the implementation of the following:

- Single-data-rate applications (e.g., PCI 66 MHz, bidirectional SSTL 2 and 3, Class I and II)
- Double-data-Rate applications (e.g., DDR LVDS, B-LVDS, and M-LVDS I/Os for point-to-point communications, and DDR 200 MHz SRAM using bidirectional HSTL Class II).

ProASIC3L banks support LVPECL, LVDS, B-LVDS, and M-LVDS. B-LVDS and M-LVDS can support up to 20 loads.

Hot-swap (also called hot-plug, or hot-insertion) is the operation of hot-insertion or hot-removal of a card in a powered-up system.

Cold-sparing (also called cold-swap) refers to the ability of a device to leave system data undisturbed when the system is powered up, while the component itself is powered down, or when power supplies are floating.

## Wide Range I/O Support

ProASIC3L devices support JEDEC-defined wide range I/O operation. ProASIC3L devices support both the JESD8-B specification, covering 3 V and 3.3 V supplies, for an effective operating range of 2.7 V to 3.6 V, and JESD8-12 with its 1.2 V nominal, supporting an effective operating range of 1.14 V to 1.575 V. Wider I/O range means designers can eliminate power supplies or power conditioning components from the board or move to less costly components with greater tolerances. Wide range eases I/O bank management and provides enhanced protection from system voltage spikes, while providing the flexibility to easily run custom voltage applications.

## Specifying I/O States During Programming

You can modify the I/O states during programming in FlashPro. In FlashPro, this feature is supported for PDB files generated from Designer v8.5 or greater. See the [FlashPro User's Guide](#) for more information.

**Note:** PDB files generated from Designer v8.1 to Designer v8.4 (including all service packs) have limited display of Pin Numbers only.

1. Load a PDB from the FlashPro GUI. You must have a PDB loaded to modify the I/O states during programming.
2. From the FlashPro GUI, click PDB Configuration. A FlashPoint – Programming File Generator window appears.
3. Click the **Specify I/O States During Programming** button to display the Specify I/O States During Programming dialog box.
4. Sort the pins as desired by clicking any of the column headers to sort the entries by that header. Select the I/Os you wish to modify ([Figure 1-5 on page 1-9](#)).
5. Set the I/O Output State. You can set Basic I/O settings if you want to use the default I/O settings for your pins, or use Custom I/O settings to customize the settings for each pin. Basic I/O state settings:
  - 1 – I/O is set to drive out logic High
  - 0 – I/O is set to drive out logic Low
  - Last Known State – I/O is set to the last value that was driven out prior to entering the programming mode, and then held at that value during programming
  - Z -Tri-State: I/O is tristated
6. Click OK to return to the FlashPoint – Programming File Generator window.

**Note:** I/O States during programming are saved to the ADB and resulting programming files after completing programming file generation.

Specify I/O States During Programming ✕

## 2 – ProASIC3L DC and Switching Characteristics

### General Specifications

#### Operating Conditions

Stresses beyond those listed in [Table 2-1](#) may cause permanent damage to the device.

Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Absolute Maximum Ratings are stress ratings only; functional operation of the device at these or any other conditions beyond those listed under the Recommended Operating Conditions specified in [Table 2-2 on page 2-2](#) is not implied.

**Table 2-1 • Absolute Maximum Ratings**

| Symbol                        | Parameter                    | Limits                                                                                                                                                            | Units |
|-------------------------------|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| VCC                           | DC core supply voltage       | –0.3 to 1.65                                                                                                                                                      | V     |
| VJTAG                         | JTAG DC voltage              | –0.3 to 3.75                                                                                                                                                      | V     |
| VPUMP                         | Programming voltage          | –0.3 to 3.75                                                                                                                                                      | V     |
| VCCPLL                        | Analog power supply (PLL)    | –0.3 to 1.65                                                                                                                                                      | V     |
| VCCI and VMV <sup>2</sup>     | DC I/O buffer supply voltage | –0.3 to 3.75                                                                                                                                                      | V     |
| VI                            | I/O input voltage            | –0.3 V to 3.6 V (when I/O hot insertion mode is enabled)<br>–0.3 V to (VCCI + 1 V) or 3.6 V, whichever voltage is lower (when I/O hot-insertion mode is disabled) | V     |
| T <sub>STG</sub> <sup>3</sup> | Storage temperature          | –65 to +150                                                                                                                                                       | °C    |
| T <sub>J</sub> <sup>3</sup>   | Junction temperature         | +125                                                                                                                                                              | °C    |

**Notes:**

1. The device should be operated within the limits specified by the datasheet. During transitions, the input signal may undershoot or overshoot according to the limits shown in [Table 2-4 on page 2-3](#).
2. VMV pins must be connected to the corresponding VCCI pins. See the "VMVx I/O Supply Voltage (quiet)" section on [page 3-1](#) for further information.
3. For flash programming and retention maximum limits, refer to [Table 2-3 on page 2-2](#), and for recommended operating limits, refer to [Table 2-2 on page 2-2](#).

**Table 2-2 • Recommended Operating Conditions <sup>1</sup>**

| Symbol                    | Parameter                                        |                                                  | Commercial     | Industrial     | Units |

|                           | 3.3 V wide range DC supply voltage <sup>9</sup>  |                                                  | 2.7 to 3.6     | 2.7 to 3.6     | V     |
|                           | 3.3 V DC supply voltage                          |                                                  | 3.0 to 3.6     | 3.0 to 3.6     | V     |
|                           | LVDS differential I/O                            |                                                  | 2.375 to 2.625 | 2.375 to 2.625 | V     |
|                           | LVPECL differential I/O                          |                                                  | 3.0 to 3.6     | 3.0 to 3.6     | V     |

**Notes:**

1. All parameters representing voltages are measured with respect to GND unless otherwise specified.
2. The ranges given here are for power supplies only. The recommended input voltage ranges specific to each I/O standard are given in [Table 2-14 on page 2-10](#). VCCI should be at the same voltage within a given I/O bank.
3. All ProASIC3L devices must be programmed with the VCC core voltage at 1.5 V.
4. The programming temperature range supported is T<sub>ambient</sub> = 0°C to 85°C.
5. VPUMP can be left floating during normal operation (not programming mode).
6. VCCPLL pins should be tied to VCC pins. See the "[VCCPLA/B/C/D/E/F PLL Supply Voltage](#)" section on [page 3-1](#) for further information.
7. VMV pins must be connected to the corresponding VCCI pins. See the "[VMVx I/O Supply Voltage \(quiet\)](#)" section on [page 3-1](#) for further information.
8. For ProASIC<sup>®</sup>3L devices, VCCI ≥ VCC.
9. 3.3 V wide range is compliant to the JESD8-A specification and supports 3.0 V VCCI operation.

**Table 2-3 • Flash Programming Limits – Retention, Storage, and Operating Temperature <sup>1</sup>**

| Product Grade | Programming Cycles | Program Retention (biased/unbiased) | Maximum Storage Temperature T <sub>STG</sub> (°C) <sup>2</sup> | Maximum Operating Junction Temperature T <sub>J</sub> (°C) <sup>2</sup> |
|---------------|--------------------|-------------------------------------|----------------------------------------------------------------|-------------------------------------------------------------------------|
| Commercial    | 500                | 20 years                            | 110                                                            | 100                                                                     |
| Industrial    | 500                | 20 years                            | 110                                                            | 100                                                                     |

**Notes:**

1. This is a stress rating only; functional operation at any condition other than those indicated is not implied.
2. These limits apply for program/data retention only. Refer to [Table 2-1 on page 2-1](#) and [Table 2-2](#) for device operating conditions and absolute limits.

**Table 2-4 • Overshoot and Undershoot Limits <sup>1</sup>**

| VCCI          | Average VCCI–GND Overshoot or Undershoot Duration as a Percentage of Clock Cycle <sup>2</sup> | Maximum Overshoot/Undershoot <sup>2</sup> |
|---------------|-----------------------------------------------------------------------------------------------|-------------------------------------------|
| 2.7 V or less | 10%                                                                                           | 1.4 V                                     |
|               | 5%                                                                                            | 1.49 V                                    |
| 3 V           | 10%                                                                                           | 1.1 V                                     |
|               | 5%                                                                                            | 1.19 V                                    |
| 3.3 V         | 10%                                                                                           | 0.79 V                                    |
|               | 5%                                                                                            | 0.88 V                                    |
| 3.6 V         | 10%                                                                                           | 0.45 V                                    |
|               | 5%                                                                                            | 0.54 V                                    |

**Notes:**

1. Based on reliability requirements at junction temperature at 85°C.
2. The duration is allowed at one out of six clock cycles. If the overshoot/undershoot occurs at one out of two cycles, the maximum overshoot/undershoot has to be reduced by 0.15 V.
3. This table does not provide PCI overshoot/undershoot limits.

## I/O Power-Up and Supply Voltage Thresholds for Power-On Reset (Commercial and Industrial)

Sophisticated power-up management circuitry is designed into every ProASIC3 device. These circuits ensure easy transition from the powered-off state to the powered-up state of the device. The many different supplies can power up in any sequence with minimized current spikes or surges. In addition, the I/O will be in a known state through the power-up sequence. The basic principle is shown in [Figure 2-1 on page 2-4](#) and [Figure 2-2 on page 2-5](#).

There are five regions to consider during power-up.

ProASIC3 I/Os are activated only if ALL of the following three conditions are met:

1. VCC and VCCI are above the minimum specified trip points ([Figure 2-1 on page 2-4](#) and [Figure 2-2 on page 2-5](#)).
2. VCCI > VCC – 0.75 V (typical)
3. Chip is in the operating mode.

**VCCI Trip Point:**

Ramping up: 0.6 V < trip\_point\_up < 1.2 V

Ramping down: 0.5 V < trip\_point\_down < 1.1 V

**VCC Trip Point:**

Ramping up: 0.6 V < trip\_point\_up < 1.1 V

Ramping down: 0.5 V < trip\_point\_down < 1 V

VCC and VCCI ramp-up trip points are about 100 mV higher than ramp-down trip points. This specifically built-in hysteresis prevents undesirable power-up oscillations and current surges. Note the following:

- During programming, I/Os become tristated and weakly pulled up to VCCI.
- JTAG supply, PLL power supplies, and charge pump VPUMP supply have no influence on I/O behavior.

## PLL Behavior at Brownout Condition

Microsemi recommends using monotonic power supplies or voltage regulators to ensure proper powerup behavior. Power ramp-up should be monotonic at least until VCC and VCCPLX exceed brownout activation levels. The VCC activation level is specified as 1.1 V worst-case (see Figure 2-1 and Figure 2-2 on page 2-5 for more details).

When PLL power supply voltage and/or VCC levels drop below the VCC brownout levels ( $0.75\text{ V} \pm 0.25\text{ V}$ ), the PLL output lock signal goes low and/or the output clock is lost. Refer to the "Power-Up/Down Behavior of Low-Power Flash Devices" chapter of the *ProASIC3L FPGA Fabric User's Guide* for information on clock and lock recovery.

## Internal Power-Up Activation Sequence

1. Core
2. Input buffers

Output buffers, after 200 ns delay from input buffer activation.

**Figure 2-1 • V5 Devices – I/O State as a Function of VCCI and VCC Voltage Levels**

**Figure 2-2 • V2 Devices – I/O State as a Function of  $V_{CCI}$  and  $V_{CC}$  Voltage Levels**

## Thermal Characteristics

### Introduction

The temperature variable in the Designer software refers to the junction temperature, not the ambient temperature. This is an important distinction because dynamic and static power consumption cause the chip junction temperature to be higher than the ambient temperature.

EQ 1 can be used to calculate junction temperature.

$$T_J = \text{Junction Temperature} = \Delta T + T_A$$

EQ 1

where:

$T_A$  = Ambient Temperature

$\Delta T$  = Temperature gradient between junction (silicon) and ambient  $\Delta T = \theta_{ja} * P$

$\theta_{ja}$  = Junction-to-ambient of the package.  $\theta_{ja}$  numbers are located in Table 2-5.

P = Power dissipation

### Package Thermal Characteristics

The device junction-to-case thermal resistivity is  $\theta_{jc}$  and the junction-to-ambient air thermal resistivity is  $\theta_{ja}$ . The thermal characteristics for  $\theta_{ja}$  are shown for two air flow rates. The absolute maximum junction temperature is 100°C. EQ 2 shows a sample calculation of the absolute maximum power dissipation allowed for a 484-pin FBGA package at commercial temperature and in still air.

$$\text{Maximum Power Allowed} = \frac{\text{Max. junction temp. (°C)} - \text{Max. ambient temp. (°C)}}{\theta_{ja} (\text{°C/W})} = \frac{100^\circ\text{C} - 70^\circ\text{C}}{20.5^\circ\text{C/W}} = 1.463 \text{ W}$$

EQ 2

**Table 2-5 • Package Thermal Resistivities**

| Package Type                      | Device      | Pin Count | $\theta_{jc}$ | $\theta_{ja}$ |              |              | Units |
|-----------------------------------|-------------|-----------|---------------|---------------|--------------|--------------|-------|
|                                   |             |           |               | Still Air     | 200 ft./min. | 500 ft./min. |       |

## Calculating Power Dissipation

### Quiescent Supply Current

Quiescent supply current ( $I_{DD}$ ) calculation depends on multiple factors, including operating voltages ( $V_{CC}$ ,  $V_{CCI}$ , and  $V_{JTAG}$ ), operating temperature, system clock frequency, and power mode usage. Microsemi recommends using the Power Calculator and SmartPower software estimation tools to evaluate the projected static and active power based on the user design, power mode usage, operating voltage, and temperature.

**Table 2-7 • Power Supply State per Mode**

| Modes/Power Supplies | Power Supply Configurations |             |           |            |                 |
|----------------------|-----------------------------|-------------|-----------|------------|-----------------|
|                      | $V_{CC}$                    | $V_{CCPLL}$ | $V_{CCI}$ | $V_{JTAG}$ | $V_{PUMP}$      |
| Flash*Freeze         | On                          | On          | On        | On         | On/off/floating |
| Sleep                | Off                         | Off         | On        | Off        | Off             |
| Shutdown             | Off                         | Off         | Off       | Off        | Off             |
| No Flash*Freeze      | On                          | On          | On        | On         | On/off/floating |

*Note:* Off: Power Supply level = 0 V

**Table 2-8 • Quiescent Supply Current ( $I_{DD}$ ) Characteristics, ProASIC3L Flash\*Freeze Mode\***

|                                | Core Voltage | A3P250L | A3P600L | A3P1000L | A3PE3000L | Units |
|--------------------------------|--------------|---------|---------|----------|-----------|-------|
| Typical ( $25^\circ\text{C}$ ) | 1.2 V        | 0.33    | 0.55    | 0.88     | 2.75      | mA    |
|                                | 1.5 V        | 0.5     | 0.83    | 1.33     | 4.2       | mA    |

*Note:* \*  $I_{DD}$  includes  $V_{CC}$ ,  $V_{PUMP}$ ,  $V_{CCI}$ ,  $V_{JTAG}$ , and  $V_{CCPLL}$  currents.

**Notes:**

1. Dynamic power consumption is given for standard load and software default drive strength and output slew.
2.  $P_{DC6}$  is the static power (where applicable) measured on VCCI.
3.  $P_{AC10}$  is the total dynamic power measured on VCCI.

| LVPECL                    | –                      | 3.3                  | 19.42                                  | 168.02                                       |

**Notes:**

1. Dynamic power consumption is given for standard load and software default drive strength and output slew.
2. PDC7 is the static power (where applicable) measured on VCCI.
3. PAC10 is the total dynamic power measured on VCCI.

**Table 2-16 • Summary of I/O Output Buffer Power (per pin) – Default I/O Software Settings <sup>1</sup>**  
**Applicable to Advanced I/O Banks**

**Notes:**

1. Dynamic power consumption is given for standard load and software default drive strength and output slew.
2. PDC7 is the static power (where applicable) measured on VCCI.
3. PAC10 is the total dynamic power measured on VCCI.

## Power Consumption of Various Internal Resources

**Table 2-18 • Different Components Contributing to Dynamic Power Consumption in ProASIC3L Devices at 1.2 V VCC**

| Parameter | Definition                                                     | Device Specific Dynamic Power (μW/MHz)                                                       |          |         |         |
|-----------|----------------------------------------------------------------|----------------------------------------------------------------------------------------------|----------|---------|---------|
|           |                                                                | A3PE3000L                                                                                    | A3P1000L | A3P600L | A3P250L |
| PAC1      | Clock contribution of a Global Rib                             | 12.61                                                                                        | 9.28     | 8.19    | 7.07    |
| PAC2      | Clock contribution of a Global Spine                           | 2.66                                                                                         | 1.59     | 1.19    | 1.01    |
| PAC3      | Clock contribution of a VersaTile row                          | 0.56                                                                                         | 0.52     |         |         |
| PAC4      | Clock contribution of a VersaTile used as a sequential module  | 0.07                                                                                         |          |         |         |
| PAC5      | First contribution of a VersaTile used as a sequential module  | 0.05                                                                                         |          |         |         |
| PAC6      | Second contribution of a VersaTile used as a sequential module | 0.19                                                                                         |          |         |         |
| PAC7      | Contribution of a VersaTile used as a combinatorial Module     | 0.11                                                                                         |          |         |         |
| PAC8      | Average contribution of a routing net                          | 0.45                                                                                         |          |         |         |
| PAC9      | Contribution of an I/O input pin (standard-dependent)          | See <a href="#">Table 2-12 on page 2-9.</a> through <a href="#">Table 2-14 on page 2-10.</a> |          |         |         |
| PAC10     | Contribution of an I/O output pin (standard-dependent)         | See <a href="#">Table 2-15 on page 2-11</a> through <a href="#">Table 2-17 on page 2-12.</a> |          |         |         |
| PAC11     | Average contribution of a RAM block during a read operation    | 25.00                                                                                        |          |         |         |
| PAC12     | Average contribution of a RAM block during a write operation   | 30.00                                                                                        |          |         |         |
| PAC13     | Dynamic contribution for PLL                                   | 1.74                                                                                         |          |         |         |

**Note:** \*For a different output load, drive strength, or slew rate, Microsemi recommends using the Microsemi power spreadsheet calculator or SmartPower tool in Libero SoC.

**Table 2-19 • Different Components Contributing to Dynamic Power Consumption in ProASIC3L Devices at 1.5 V VCC**

| Parameter | Definition                                                     | Device Specific Dynamic Power (μW/MHz)                                                       |          |         |         |
|-----------|----------------------------------------------------------------|----------------------------------------------------------------------------------------------|----------|---------|---------|
|           |                                                                | A3PE3000L                                                                                    | A3P1000L | A3P600L | A3P250L |
| PAC1      | Clock contribution of a Global Rib                             | 19.7                                                                                         | 14.50    | 12.80   | 11.00   |
| PAC2      | Clock contribution of a Global Spine                           | 4.16                                                                                         | 2.48     | 1.85    | 1.58    |
| PAC3      | Clock contribution of a VersaTile row                          | 0.88                                                                                         | 0.81     |         |         |
| PAC4      | Clock contribution of a VersaTile used as a sequential module  | 0.12                                                                                         |          |         |         |
| PAC5      | First contribution of a VersaTile used as a sequential module  | 0.07                                                                                         |          |         |         |
| PAC6      | Second contribution of a VersaTile used as a sequential module | 0.29                                                                                         |          |         |         |
| PAC7      | Contribution of a VersaTile used as a combinatorial Module     | 0.29                                                                                         |          |         |         |
| PAC8      | Average contribution of a routing net                          | 0.70                                                                                         |          |         |         |

| PDC2      | Array static power in Static (Idle) mode                    | See Table 2-9 on page 2-8.                                                |          |         |         |
| PDC3      | Array static power in Flash*Freeze mode                     | See Table 2-8 on page 2-7.                                                |          |         |         |
| PDC4      | Static PLL contribution at 1.2 V core (operating mode only) | 1.42 mW                                                                   |          |         |         |
|           | Static PLL contribution at 1.5 V core (operating mode only) | 2.55 mW                                                                   |          |         |         |
| PDC5      | Bank quiescent power (VCCI-dependent)                       | See Table 2-8 on page 2-7, Table 2-9 on page 2-8, Table 2-11 on page 2-8. |          |         |         |
| PDC6      | I/O input pin static power (standard-dependent)             | See Table 2-12 on page 2-9 through Table 2-14 on page 2-10.               |          |         |         |
| PDC7      | I/O output pin static power (standard-dependent)            | See Table 2-15 on page 2-11 through Table 2-17 on page 2-12.              |          |         |         |

**Note:** \*For a different output load, drive strength, or slew rate, Microsemi recommends using the Microsemi power spreadsheet calculator or SmartPower tool in Libero SoC.

## Power Calculation Methodology

This section describes a simplified method to estimate power consumption of an application. For more accurate and detailed power estimations, use the SmartPower tool in Libero SoC software.

The power calculation methodology described below uses the following variables:

- The number of PLLs as well as the number and the frequency of each output clock generated
- The number of combinatorial and sequential cells used in the design
- The internal clock frequencies
- The number and the standard of I/O pins used in the design
- The number of RAM blocks used in the design
- Toggle rates of I/O pins as well as VersaTiles—guidelines are provided in [Table 2-21 on page 2-17](#).
- Enable rates of output buffers—guidelines are provided for typical applications in [Table 2-22 on page 2-17](#).
- Read rate and write rate to the memory—guidelines are provided for typical applications in [Table 2-22 on page 2-17](#). The calculation should be repeated for each clock domain defined in the design.

### Methodology

#### Total Power Consumption— $P_{TOTAL}$

$$P_{TOTAL} = P_{STAT} + P_{DYN}$$

$P_{STAT}$  is the total static power consumption.

$P_{DYN}$  is the total dynamic power consumption.

#### Total Static Power Consumption— $P_{STAT}$

$$P_{STAT} = (PDC1 \text{ or } PDC2 \text{ or } PDC3) + N_{BANKS} * PDC5 + N_{INPUTS} * PDC6 + N_{OUTPUTS} * PDC7$$

$N_{INPUTS}$  is the number of I/O input buffers used in the design.

$N_{OUTPUTS}$  is the number of I/O output buffers used in the design.

$N_{BANKS}$  is the number of I/O banks powered in the design.

#### Total Dynamic Power Consumption— $P_{DYN}$

$$P_{DYN} = P_{CLOCK} + P_{S-CELL} + P_{C-CELL} + P_{NET} + P_{INPUTS} + P_{OUTPUTS} + P_{MEMORY} + P_{PLL}$$

#### Global Clock Contribution— $P_{CLOCK}$

$$P_{CLOCK} = (PAC1 + N_{SPINE} * PAC2 + N_{ROW} * PAC3 + N_{S-CELL} * PAC4) * F_{CLK}$$

$N_{SPINE}$  is the number of global spines used in the user design—guidelines are provided in the "Spine Architecture" section of the [ProASIC3L FPGA Fabric User's Guide](#).

$N_{ROW}$  is the number of VersaTile rows used in the design—guidelines are provided in the "Spine Architecture" section of the [ProASIC3L FPGA Fabric User's Guide](#).

$F_{CLK}$  is the global clock signal frequency.

$N_{S-CELL}$  is the number of VersaTiles used as sequential modules in the design.

PAC1, PAC2, PAC3, and PAC4 are device-dependent.

#### Sequential Cells Contribution— $P_{S-CELL}$

$$P_{S-CELL} = N_{S-CELL} * (PAC5 + \alpha_1 / 2 * PAC6) * F_{CLK}$$

$N_{S-CELL}$  is the number of VersaTiles used as sequential modules in the design. When a multi-tile sequential cell is used, it should be accounted for as 1.

$\alpha_1$  is the toggle rate of VersaTile outputs—guidelines are provided in [Table 2-21 on page 2-17](#).

$F_{CLK}$  is the global clock signal frequency.

### Combinatorial Cells Contribution— $P_{C-CELL}$

$$P_{C-CELL} = N_{C-CELL} * \alpha_1 / 2 * PAC7 * F_{CLK}$$

$N_{C-CELL}$  is the number of VersaTiles used as combinatorial modules in the design.

$\alpha_1$  is the toggle rate of VersaTile outputs—guidelines are provided in [Table 2-21 on page 2-17](#).

$F_{CLK}$  is the global clock signal frequency.

### Routing Net Contribution— $P_{NET}$

$$P_{NET} = (N_{S-CELL} + N_{C-CELL}) * \alpha_1 / 2 * PAC8 * F_{CLK}$$

$N_{S-CELL}$  is the number of VersaTiles used as sequential modules in the design.

$N_{C-CELL}$  is the number of VersaTiles used as combinatorial modules in the design.

$\alpha_1$  is the toggle rate of VersaTile outputs—guidelines are provided in [Table 2-21 on page 2-17](#).

$F_{CLK}$  is the global clock signal frequency.

### I/O Input Buffer Contribution— $P_{INPUTS}$

$$P_{INPUTS} = N_{INPUTS} * \alpha_2 / 2 * PAC9 * F_{CLK}$$

$N_{INPUTS}$  is the number of I/O input buffers used in the design.

$\alpha_2$  is the I/O buffer toggle rate—guidelines are provided in [Table 2-21 on page 2-17](#).

$F_{CLK}$  is the global clock signal frequency.

### I/O Output Buffer Contribution— $P_{OUTPUTS}$

$$P_{OUTPUTS} = N_{OUTPUTS} * \alpha_2 / 2 * \beta_1 * PAC10 * F_{CLK}$$

$N_{OUTPUTS}$  is the number of I/O output buffers used in the design.

$\alpha_2$  is the I/O buffer toggle rate—guidelines are provided in [Table 2-21 on page 2-17](#).

$\beta_1$  is the I/O buffer enable rate—guidelines are provided in [Table 2-22 on page 2-17](#).

$F_{CLK}$  is the global clock signal frequency.

### RAM Contribution— $P_{MEMORY}$

$$P_{MEMORY} = PAC11 * N_{BLOCKS} * F_{READ-CLOCK} * \beta_2 + PAC12 * N_{BLOCK} * F_{WRITE-CLOCK} * \beta_3$$

$N_{BLOCKS}$  is the number of RAM blocks used in the design.

$F_{READ-CLOCK}$  is the memory read clock frequency.

$\beta_2$  is the RAM enable rate for read operations.

$F_{WRITE-CLOCK}$  is the memory write clock frequency.

$\beta_3$  is the RAM enable rate for write operations—guidelines are provided in [Table 2-22 on page 2-17](#).

### PLL Contribution— $P_{PLL}$

$$P_{PLL} = PDC4 + PAC13 * F_{CLKOUT}$$

$F_{CLKOUT}$  is the output clock frequency.<sup>1</sup>

1. If a PLL is used to generate more than one output clock, include each output clock in the formula by adding its corresponding contribution ( $PAC13 * F_{CLKOUT}$  product) to the total PLL contribution.

## Guidelines

### Toggle Rate Definition

A toggle rate defines the frequency of a net or logic element relative to a clock. It is a percentage. If the toggle rate of a net is 100%, this means that this net switches at half the clock frequency. Below are some examples:

- The average toggle rate of a shift register is 100% because all flip-flop outputs toggle at half of the clock frequency.
- The average toggle rate of an 8-bit counter is 25%:
  - Bit 0 (LSB) = 100%
  - Bit 1 = 50%
  - Bit 2 = 25%
  - ...
  - Bit 7 (MSB) = 0.78125%
  - Average toggle rate =  $(100\% + 50\% + 25\% + 12.5\% + \dots + 0.78125\%) / 8$

### Enable Rate Definition

Output enable rate is the average percentage of time during which tristate outputs are enabled. When nontristate output buffers are used, the enable rate should be 100%.

**Table 2-21 • Toggle Rate Guidelines Recommended for Power Calculation**

| Component  | Definition                       | Guideline |
|------------|----------------------------------|-----------|
| $\alpha_1$ | Toggle rate of VersaTile outputs | 10%       |
| $\alpha_2$ | I/O buffer toggle rate           | 10%       |

**Table 2-22 • Enable Rate Guidelines Recommended for Power Calculation**

| Component | Definition                           | Guideline |
|-----------|--------------------------------------|-----------|
| $\beta_1$ | I/O output buffer enable rate        | 100%      |
| $\beta_2$ | RAM enable rate for read operations  | 12.5%     |
| $\beta_3$ | RAM enable rate for write operations | 12.5%     |

## User I/O Characteristics

### Timing Model

**Figure 2-3 • Timing Model**  
Operating Conditions: -1 Speed, Commercial Temperature Range ( $T_J = 70^\circ\text{C}$ ), Worst-Case  $V_{CC} = 1.14 \text{ V}$

#### Notes:

1. Please note that 1.2V LVC MOS and 3.3V LVC MOS wide range is applicable to 100uA drive strength only. The configuration will NOT operate at the equivalent software.
2. Maximum VIH is 3.6 V for all I/O standards with hot-insertion is enabled.
3. Currents are measured at 85°C junction temperature.
4. All LVC MOS 3.3 V software macros support LVC MOS 3.3 V wide range as specified in the JESD-8B specification.
5. All LVC MOS 1.2 V software macros support LVC MOS 1.2 V wide range as specified in the JESD8-12 specification.
6. Output drive strength is below JEDEC specification.
7. Output slew rate can be extracted using the IBIS models.

**Notes:**

1. Commercial range ( $0^{\circ}\text{C} < T_A < 70^{\circ}\text{C}$ )
2. Industrial range ( $-40^{\circ}\text{C} < T_A < 85^{\circ}\text{C}$ )
3. IIL is the input leakage current per I/O pin over recommended operation conditions where  $-0.3\text{V} < V_{IN} < V_{IL}$ .
4. IIH is the input leakage current per I/O pin over recommended operating conditions  $V_{IH} < V_{IN} < V_{CCI}$ . Input current is larger when operating outside recommended ranges.
5. Applicable to devices operating at  $V_{CCI} \geq V_{CC}$ .

## Summary of I/O Timing Characteristics – Default I/O Software Settings

**Table 2-27 • Summary of AC Measuring Points**

| Standard                    | Input Reference Voltage (VREF_TYP) | Board Termination Voltage (VTT_REF) | Measuring Trip Point (Vtrip) |
|-----------------------------|------------------------------------|-------------------------------------|------------------------------|
| 3.3 V LVTTTL / 3.3 V LVCMOS | –                                  | –                                   | 1.4 V                        |
| 3.3 V LVCMOS Wide Range     | –                                  | –                                   | 1.4 V                        |
| 2.5 V LVCMOS                | –                                  | –                                   | 1.2 V                        |
| 1.8 V LVCMOS                | –                                  | –                                   | 0.90 V                       |
| 1.5 V LVCMOS                | –                                  | –                                   | 0.75 V                       |
| 1.2 V LVCMOS *              | –                                  | –                                   | 0.6 V                        |

#### Notes:

1. The minimum drive strength for any LVCMOS 1.2 V or LVCMOS 3.3 V software configuration when run in wide range is  $\pm 100 \mu\text{A}$ . Drive strength displayed in the software is supported for normal range only. For a detailed I/V curve, refer to the IBIS models.
2. All LVCMOS 3.3 V software macros support LVCMOS 3.3 V wide range as specified in the JESD8-B specification.
3. Resistance is used to measure I/O propagation delays as defined in PCI specifications. See [Figure 2-12 on page 2-81](#) for connectivity. This resistor is not required during normal operation.
4. For specific junction temperature and voltage supply levels, refer to [Table 2-6 on page 2-7](#) for derating values.
5. Output drive strength is below JEDEC specification.

**Table 2-30 • Summary of I/O Timing Characteristics—Software Default Settings**  
–1 Speed Grade, Commercial-Case Conditions:  $T_J = 70^{\circ}\text{C}$ , Worst Case  $V_{CC} = 1.425\text{ V}$ , Worst Case  $V_{CCI}$

**Notes:**

1. The minimum drive strength for any LVCMOS 1.2 V or LVCMOS 3.3 V software configuration when run in wide range is  $\pm 100\text{ }\mu\text{A}$ . Drive strength displayed in the software is supported for normal range only. For a detailed I/V curve, refer to the IBIS models.
2. All LVCMOS 3.3 V software macros support LVCMOS 3.3 V wide range as specified in the JESD8-B specification.
3. Resistance is used to measure I/O propagation delays as defined in PCI specifications. See [Figure 2-12 on page 2-81](#) for connectivity. This resistor is not required during normal operation.
4. For specific junction temperature and voltage supply levels, refer to [Table 2-6 on page 2-7](#) for derating values.

**Notes:**

1. The minimum drive strength for any LVCMOS 1.2 V or LVCMOS 3.3 V software configuration when run in wide range is  $\pm 100\text{ }\mu\text{A}$ . Drive strength displayed in the software is supported for normal range only. For a detailed I/V curve, refer to the IBIS models.
2. All LVCMOS 3.3 V software macros support LVCMOS 3.3 V wide range as specified in the JESD8-B specification.
3. All LVCMOS 1.2 V software macros support LVCMOS 1.2 V wide range as specified in the JESD8-12 specification.
4. Resistance is used to measure I/O propagation delays as defined in PCI specifications. See [Figure 2-12 on page 2-81](#) for connectivity. This resistor is not required during normal operation.
5. For specific junction temperature and voltage supply levels, refer to [Table 2-6 on page 2-7](#) for derating values.
6. Output drive strength is below JEDEC specification.

**Notes:**

1. The minimum drive strength for any LVCMOS 1.2 V or LVCMOS 3.3 V software configuration when run in wide range is  $\pm 100\ \mu\text{A}$ . Drive strength displayed in the software is supported for normal range only. For a detailed I/V curve, refer to the IBIS models.
2. All LVCMOS 3.3 V software macros support LVCMOS 3.3 V wide range as specified in the JESD8-B specification.
3. All LVCMOS 1.2 V software macros support LVCMOS 1.2 V wide range as specified in the JESD8-12 specification.
4. Resistance is used to measure I/O propagation delays as defined in PCI specifications. See [Figure 2-12 on page 2-81](#) for connectivity. This resistor is not required during normal operation.
5. For specific junction temperature and voltage supply levels, refer to [Table 2-6 on page 2-7](#) for derating values.

**Notes:**

1. The minimum drive strength for any LVCMOS 1.2 V or LVCMOS 3.3 V software configuration when run in wide range is  $\pm 100\text{ }\mu\text{A}$ . Drive strength displayed in the software is supported for normal range only. For a detailed I/V curve, refer to the IBIS models.
2. All LVCMOS 3.3 V software macros support LVCMOS 3.3 V wide range as specified in the JESD8-B specification.
3. All LVCMOS 1.2 V software macros support LVCMOS 1.2 V wide range as specified in the JESD8-12 specification.
4. Resistance is used to measure I/O propagation delays as defined in PCI specifications. See [Figure 2-12 on page 2-81](#) for connectivity. This resistor is not required during normal operation.
5. For specific junction temperature and voltage supply levels, refer to [Table 2-6 on page 2-7](#) for derating values.

## Detailed I/O DC Characteristics

**Table 2-35 • Input Capacitance**

| Symbol      | Definition                         | Conditions                          | Min. | Max. | Units |
|-------------|------------------------------------|-------------------------------------|------|------|-------|
| $C_{IN}$    | Input capacitance                  | $V_{IN} = 0$ , $f = 1.0\text{ MHz}$ |      | 8    | pF    |
| $C_{INCLK}$ | Input capacitance on the clock pin | $V_{IN} = 0$ , $f = 1.0\text{ MHz}$ |      | 8    | pF    |

| SSTL3 (II)                  | 21 mA                       | 18                                         | 32                                       |

**Notes:**

1. These maximum values are provided for informational reasons only. Minimum output buffer resistance values depend on VCCI, drive strength selection, temperature, and process. For board design considerations and detailed output buffer resistances, use the corresponding IBIS models located at <http://www.microsemi.com/soc/download/ibis/default.aspx>.
2.  $R_{(PULL-DOWN-MAX)} = (VOL_{spec}) / IOL_{spec}$
3.  $R_{(PULL-UP-MAX)} = (VCCI_{max} - VOH_{spec}) / IOH_{spec}$
4. Output drive strength is below JEDEC specification.

Note:  $T_J = 100^{\circ}\text{C}$

**Table 2-43 • Schmitt Trigger Input Hysteresis, Hysteresis Voltage Value (Typ) for Schmitt Mode Input Buffers**

| Input Buffer Configuration                           | Hysteresis Value (typ.) |
|------------------------------------------------------|-------------------------|
| 3.3 V LVTTTL/LVCMOS/PCI/PCI-X (Schmitt trigger mode) | 240 mV                  |
| 2.5 V LVCMOS (Schmitt trigger mode)                  | 140 mV                  |
| 1.8 V LVCMOS (Schmitt trigger mode)                  | 80 mV                   |
| 1.5 V LVCMOS (Schmitt trigger mode)                  | 60 mV                   |
| 1.2 V LVCMOS (Schmitt trigger mode)                  | 40 mV                   |

The length of time an I/O can withstand IOSH/IOSL events depends on the junction temperature. The reliability data below is based on a 3.3 V, 12 mA I/O setting, which is the worst case for this type of analysis.

For example, at 100°C, the short current condition would have to be sustained for more than six months to cause a reliability concern. The I/O design does not contain any short circuit protection, but such protection would only be needed in extremely prolonged stress conditions.

**Table 2-44 • Duration of Short Circuit Event before Failure**

| Temperature | Time before Failure |
|-------------|---------------------|
| –40°C       | > 20 years          |
| 0°C         | > 20 years          |
| 25°C        | > 20 years          |
| 70°C        | 5 years             |
| 85°C        | 2 years             |
| 100°C       | 6 months            |

**Table 2-45 • I/O Input Rise Time, Fall Time, and Related I/O Reliability**

| Input Buffer                  | Input Rise/Fall Time (min.) | Input Rise/Fall Time (max.) | Reliability      |
|-------------------------------|-----------------------------|-----------------------------|------------------|
| LVTTL/LVCMOS                  | No requirement              | 10 ns *                     | 20 years (110°C) |
| LVDS/B-LVDS/<br>M-LVDS/LVPECL | No requirement              | 10 ns *                     | 10 years (100°C) |

**Note:** \*The maximum input rise/fall time is related to the noise induced into the input buffer trace. If the noise is low, then the rise time and fall time of input buffers can be increased beyond the maximum value. The longer the rise/fall times, the more susceptible the input signal is to the board noise. Microsemi recommends signal integrity evaluation/characterization of the system to ensure that there is no excessive noise coupling into input signals.

## Single-Ended I/O Characteristics

### 3.3 V LVTTTL / 3.3 V LVCMOS

Low voltage transistor–transistor Logic (LVTTTL) is a general-purpose standard (EIA/JESD) for 3.3 V applications. This standard uses an LVTTTL input buffer and push-pull output buffer. Furthermore, all LVCMOS 3.3 V software macros comply with LVCMOS 3.3 V wide range, as specified in the JESD8-A specification.

**Notes:**

1. The minimum drive strength for any LVCMOS 3.3 V software configuration when run in wide range is ±100 μA. Drive strength displayed in the software is supported for normal range only. For a detailed I/V curve, refer to the IBIS models.
2. Currents are measured at 85°C junction temperature.
3. All LVCMOS 3.3 V software macros support LVCMOS 3.3 V wide range as specified in the JDEC8-B specification
4. Software default selection highlighted in gray.

## 2.5 V LVCMOS

Low-Voltage CMOS for 2.5 V is an extension of the LVCMOS standard (JESD8-5) used for general-purpose 2.5 V applications.

**Table 2-65 • Minimum and Maximum DC Input and Output Levels**  
Applicable to Pro I/Os

**Notes:**

1. Currents are measured at 100°C junction temperature and maximum voltage.
2. Currents are measured at 85°C junction temperature.
3. Software default selection highlighted in gray.

**Figure 2-8 • AC Loading**

**Table 2-68 • AC Waveforms, Measuring Points, and Capacitive Loads**

| Input Low (V) | Input High (V) | Measuring Point* (V) | C <sub>LOAD</sub> (pF) |
|---------------|----------------|----------------------|------------------------|
| 0             | 2.5            | 1.2                  | 5                      |

**Note:** \*Measuring point = V<sub>trip</sub>. See Table 2-27 on page 2-26 for a complete table of trip points.

## Timing Characteristics

### 1.5 V DC Core Voltage

**Table 2-69 • 2.5 V LVCMOS Low Slew – Applies to 1.5 V DC Core Voltage**  
 Commercial-Case Conditions:  $T_J = 70^\circ\text{C}$ , Worst-Case  $V_{CC} = 1.425\text{ V}$ , Worst-Case  $V_{CCI} = 2.3\text{ V}$   
 Applicable to Pro I/O Banks

## 1.8 V LVCMOS

Low-voltage CMOS for 1.8 V is an extension of the LVCMOS standard (JESD8-5) used for general-purpose 1.8 V applications. It uses a 1.8 V input buffer and a push-pull output buffer.

**Table 2-81 • Minimum and Maximum DC Input and Output Levels**

### 1.5 V LVCMOS (JESD8-11)

Low-Voltage CMOS for 1.5 V is an extension of the LVCMOS standard (JESD8-5) used for general-purpose 1.5 V applications. It uses a 1.5 V input buffer and a push-pull output buffer.

**Notes:**

1. Software default selection highlighted in gray.
2. For specific junction temperature and voltage supply levels, refer to [Table 2-6 on page 2-7](#) for derating values.

## 1.2 V LVCMOS (JESD8-12A)

Low-Voltage CMOS for 1.2 V complies with the LVCMOS standard JESD8-12A for general purpose 1.2 V applications. It uses a 1.2 V input buffer and a push-pull output buffer.

**Table 2-113 • Minimum and Maximum DC Input and Output Levels**  
Applicable to Advanced I/O Banks

| 1.2 V LVCMOS   | VIL    |             | VIH         |        | VOL         | VOH         | IOL | IOH | IOSH <sup>1</sup> | IOSL <sup>1</sup> | IIL <sup>2</sup> | IIH <sup>2</sup> |

**Table 2-125 • Minimum and Maximum DC Input and Output Levels for LVCMOS 1.2 V Wide Range**  
 Applicable to Standard Plus I/O Banks

| 1.2 V LVCMOS Wide Range | Equivalent Software Default Drive | VIL    |                  | VIH              |        | VOL              | VOH              | IOL           | IOH           | IOSH               | IOSL               | IIL           | IIH           |
|-------------------------|-----------------------------------|--------|------------------|------------------|--------|------------------|------------------|---------------|---------------|--------------------|--------------------|---------------|---------------|
|                         |                                   | Min. V | Max. V           | Min. V           | Max. V | Max. V           | Min. V           | $\mu\text{A}$ | $\mu\text{A}$ | Max. $\text{mA}^2$ | Max. $\text{mA}^2$ | $\mu\text{A}$ | $\mu\text{A}$ |
| 100 $\mu\text{A}$       | 2 mA                              | -0.3   | $0.35 * V_{CCI}$ | $0.65 * V_{CCI}$ | 1.26   | $0.25 * V_{CCI}$ | $0.75 * V_{CCI}$ | 100           | 100           | 20                 | 26                 | 10            | 10            |

**Notes:**

1. The minimum drive strength for any LVCMOS 3.3 V software configuration when run in wide range is  $\pm 100 \mu\text{A}$ . Drive strength displayed in the software is supported for normal range only. For a detailed I/V curve, refer to the IBIS models.
2. Currents are measured at 85°C junction temperature.
3. All LVCMOS 1.2 V software macros support LVCMOS 3.3 V wide range as specified in the JDEC8-12 specification
4. Software default selection highlighted in gray.

### 3.3 V PCI, 3.3 V PCI-X

Peripheral Component Interface for 3.3 V standard specifies support for 33 MHz and 66 MHz PCI Bus applications.

**Table 2-126 • Minimum and Maximum DC Input and Output Levels**

| 3.3 V PCI/PCI-X       | VIL            |           | VIH       |           | VOL       | VOH       | IOL | IOH | IOSL                    | IOSH                    | IIL             | IIH             |

*Note:* For specific junction temperature and voltage supply levels, refer to [Table 2-6 on page 2-7](#) for derating values.

## Voltage-Referenced I/O Characteristics

### 3.3 V GTL

Gunning Transceiver Logic is a high-speed bus standard (JESD8-3). It provides a differential amplifier input buffer and an open-drain output buffer. The  $V_{CCI}$  pin should be connected to 3.3 V.

**Table 2-134 • Minimum and Maximum DC Input and Output Levels**

| 3.3 V GTL          | VIL    |             | VIH         |        | VOL    | VOH    | IOL | IOH | IOSL                 | IOSH                 | IIL             | IIH             |
|--------------------|--------|-------------|-------------|--------|--------|--------|-----|-----|----------------------|----------------------|-----------------|-----------------|
| Drive Strength     | Min. V | Max. V      | Min. V      | Max. V | Max. V | Min. V | mA  | mA  | Max. mA <sup>1</sup> | Max. mA <sup>1</sup> | μA <sup>2</sup> | μA <sup>2</sup> |
| 20 mA <sup>3</sup> | -0.3   | VREF - 0.05 | VREF + 0.05 | 3.6    | 0.4    | -      | 20  | 20  | 268                  | 181                  | 10              | 10              |

**Notes:**

1. Currents are measured at 100°C junction temperature and maximum voltage.
2. Currents are measured at 85°C junction temperature.
3. Output drive strength is below JEDEC specification.

**Figure 2-13 • AC Loading**

**Table 2-135 • AC Waveforms, Measuring Points, and Capacitive Loads**

| Input Low (V) | Input High (V) | Measuring Point* (V) | VREF (typ.) (V) | VTT (typ.) (V) | C <sub>LOAD</sub> (pF) |

**Note:** For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-7 for derating values.

## Differential I/O Characteristics

### Physical Implementation

Configuration of the I/O modules as a differential pair is handled by Designer software when the user instantiates a differential I/O macro in the design.

Differential I/Os can also be used in conjunction with the embedded Input Register (InReg), Output Register (OutReg), Enable Register (EnReg), and Double Data Rate (DDR). However, there is no support for bidirectional I/Os or tristates with the LVPECL standards.

### LVDS

Low-Voltage Differential Signaling (ANSI/TIA/EIA-644) is a high-speed, differential I/O standard. It requires that one data bit be carried through two signal lines, so two pins are needed. It also requires external resistor termination.

The full implementation of the LVDS transmitter and receiver is shown in an example in [Figure 2-23](#). The building blocks of the LVDS transmitter-receiver are one transmitter macro, one receiver macro, three board resistors at the transmitter end, and one resistor at the receiver end. The values for the three driver resistors are different from those used in the LVPECL implementation because the output standard specifications are different.

Along with LVDS I/O, ProASIC3 also supports Bus LVDS structure and Multipoint LVDS (M-LVDS) configuration (up to 40 nodes).

**Figure 2-23 • LVDS Circuit Diagram and Board-Level Implementation**

**Table 2-174 • Minimum and Maximum DC Input and Output Levels**

| DC Parameter                 | Description                 | Min.  | Typ.  | Max.  | Units |

## B-LVDS/M-LVDS

Bus LVDS (B-LVDS) and Multipoint LVDS (M-LVDS) specifications extend the existing LVDS standard to high-performance multipoint bus applications. Multidrop and multipoint bus configurations may contain any combination of drivers, receivers, and transceivers. Microsemi LVDS drivers provide the higher drive current required by B-LVDS and M-LVDS to accommodate the loading. The drivers require series terminations for better signal quality and to control voltage swing. Termination is also required at both ends of the bus since the driver can be located anywhere on the bus. These configurations can be implemented using the TRIBUF\_LVDS and BIBUF\_LVDS macros along with appropriate terminations. Multipoint designs using Microsemi LVDS macros can achieve up to 200 MHz with a maximum of 20 loads. A sample application is given in [Figure 2-24](#). The input and output buffer delays are available in the LVDS section in [Table 2-174](#) on page 2-100.

Example: For a bus consisting of 20 equidistant loads, the following terminations provide the required differential voltage, in worst-case Industrial operating conditions, at the farthest receiver:  $R_S = 60\ \Omega$  and  $R_T = 70\ \Omega$ , given  $Z_0 = 50\ \Omega$  (2") and  $Z_{stub} = 50\ \Omega$  (~1.5").

**Figure 2-24 • B-LVDS/M-LVDS Multipoint Application Using LVDS I/O Buffers**

## LVPECL

Low-Voltage Positive Emitter-Coupled Logic (LVPECL) is another differential I/O standard. It requires that one data bit be carried through two signal lines. Like LVDS, two pins are needed. It also requires external resistor termination.

The full implementation of the LVDS transmitter and receiver is shown in an example in [Figure 2-25](#). The building blocks of the LVPECL transmitter-receiver are one transmitter macro, one receiver macro, three board resistors at the transmitter end, and one resistor at the receiver end. The values for the three driver resistors are different from those used in the LVDS implementation because the output standard specifications are different.

**Figure 2-25 • LVPECL Circuit Diagram and Board-Level Implementation**

**Table 2-180 • Minimum and Maximum DC Input and Output Levels**

| DC Parameter | Description                    | Min.  | Max. | Min.  | Max. | Min.  | Max. | Units |
|--------------|--------------------------------|-------|------|-------|------|-------|------|-------|
| VCCI         | Supply Voltage                 | 3.0   | 3.3  | 3.6   |      |       |      | V     |

*Note:* For specific junction temperature and voltage supply levels, refer to [Table 2-6 on page 2-7](#) for derating values.

## Global Resource Characteristics

### A3P250L Clock Tree Topology

Clock delays are device-specific. Figure 2-39 is an example of a global tree used for clock routing. The global tree presented in Figure 2-39 is driven by a CCC located on the west side of the A3P250L device. It is used to drive all D-flip-flops in the device.

**Figure 2-39 • Example of Global Tree Use in an A3P250L Device for Clock Routing**

## Global Tree Timing Characteristics

Global clock delays include the central rib delay, the spine delay, and the row delay. Delays do not include I/O input buffer clock delays, as these are I/O standard-dependent, and the clock may be driven and conditioned internally by the CCC module. For more details on clock conditioning capabilities, refer to the "Clock Conditioning Circuits" section on page 2-132. Table 2-204 to Table 2-210 on page 2-131 present minimum and maximum global clock delays within each device. Minimum and maximum delays are measured with minimum and maximum loading.

### Timing Characteristics

**Table 2-204 • A3P250L Global Resource – Applies to 1.5 V DC Core Voltage**  
**Commercial-Case Conditions:  $T_J = 70^\circ\text{C}$ ,  $V_{CC} = 1.425\text{ V}$**

| Parameter     | Description                               | –1                |                   | Std.              |                   | Units |

|               |                                           | Min. <sup>1</sup> | Max. <sup>2</sup> | Min. <sup>1</sup> | Max. <sup>2</sup> |       |
| $t_{RCKL}$    | Input Low Delay for Global Clock          | 0.82              | 1.06              | 0.96              | 1.25              | ns    |
| $t_{RCKH}$    | Input High Delay for Global Clock         | 0.80              | 1.09              | 0.94              | 1.28              | ns    |
| $t_{RCKMPWH}$ | Minimum Pulse Width High for Global Clock | 0.75              |                   | 0.88              |                   | ns    |
| $t_{RCKMPWL}$ | Minimum Pulse Width Low for Global Clock  | 0.85              |                   | 1.00              |                   | ns    |
| $t_{RCKSW}$   | Maximum Skew for Global Clock             |                   | 0.29              |                   | 0.34              | ns    |

#### Notes:

1. Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).
2. Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).
3. For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-7 for derating values.

**Table 2-205 • A3P250L Global Resource – Applies to 1.2 V DC Core Voltage**

| $t_{RCKL}$    | Input Low Delay for Global Clock          | 1.52              | 1.94              | 1.78              | 2.28              | ns    |
| $t_{RCKH}$    | Input High Delay for Global Clock         | 1.49              | 1.96              | 1.76              | 2.30              | ns    |
| $t_{RCKMPWH}$ | Minimum Pulse Width High for Global Clock | 1.05              |                   | 1.24              |                   | ns    |
| $t_{RCKMPWL}$ | Minimum Pulse Width Low for Global Clock  | 1.23              |                   | 1.44              |                   | ns    |
| $t_{RCKSW}$   | Maximum Skew for Global Clock             |                   | 0.47              |                   | 0.55              | ns    |

**Notes:**

1. Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).
2. Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).
3. For specific junction temperature and voltage supply levels, refer to [Table 2-6 on page 2-7](#) for derating values.

## Clock Conditioning Circuits

### CCC Electrical Specifications

#### Timing Characteristics

**Table 2-212 • ProASIC3L CCC/PLL Specification**  
 CCC/PLL Operating at 1.2 V

| Parameter                                                      | Min.                           | Typ.             | Max.                   | Units |
|----------------------------------------------------------------|--------------------------------|------------------|------------------------|-------|
| Clock Conditioning Circuitry Input Frequency $f_{IN\_CCC}$     | 1.5                            |                  | 250                    | MHz   |
| Clock Conditioning Circuitry Output Frequency $f_{OUT\_CCC}$   | 0.75                           |                  | 250                    | MHz   |
| Delay Increments in Programmable Delay Blocks <sup>1, 2</sup>  |                                | 270 <sup>3</sup> |                        | ps    |
| Number of Programmable Values in Each Programmable Delay Block |                                |                  | 32                     |       |
| Serial Clock (SCLK) for Dynamic PLL <sup>4</sup>               |                                |                  | 100                    | MHz   |
| Input Cycle-to-Cycle Jitter (peak magnitude)                   |                                |                  | 1                      | ns    |

| Delay Range in Block: Programmable Delay 1 <sup>1, 2</sup>     | 1.2                            |                  | 15.65                  | ns    |
| Delay Range in Block: Programmable Delay 2 <sup>1, 2</sup>     | 0.025                          |                  | 15.65                  | ns    |
| Delay Range in Block: Fixed Delay <sup>1, 2</sup>              |                                | 3.1              |                        | ns    |

#### Notes:

1. This delay is a function of voltage and temperature. See [Table 2-6 on page 2-7](#) for deratings.
2.  $T_J = 25^\circ\text{C}$ ,  $V_{CC} = 1.2\text{ V}$
3. When the CCC/PLL core is generated by Microsemi core generator software, not all delay values of the specified delay increments are available. Refer to the [Libero SoC Online Help](#) for more information.
4. Maximum value obtained for a –1 speed grade device in worst-case commercial conditions. For specific junction temperature and voltage supply levels, refer to [Table 2-6 on page 2-7](#) for derating values.
5. Tracking jitter is defined as the variation in clock edge position of PLL outputs with reference to PLL input clock edge. Tracking jitter does not measure the variation in PLL output period, which is covered by the period jitter parameter.

**Table 2-213 • ProASIC3L CCC/PLL Specification**  
**CCC/PLL Operating at 1.5 V**

| Parameter                                                      | Min.                           | Typ.             | Max.                   | Units |

*Note:* For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-7 for derating values.

---

## 3 – Pin Descriptions and Packaging

---

### Supply Pins

**GND****Ground**

Ground supply voltage to the core, I/O outputs, and I/O logic.

**GNDQ****Ground (quiet)**

Quiet ground supply voltage to input buffers of I/O banks. Within the package, the GNDQ plane is decoupled from the simultaneous switching noise originated from the output buffer ground domain. This minimizes the noise transfer within the package and improves input signal integrity. GNDQ must always be connected to GND on the board.

**VCC****Core Supply Voltage**

Supply voltage to the FPGA core, nominally 1.2 V or 1.5 V. VCC is required for powering the JTAG state machine in addition to VJTAG. Even when a device is in bypass mode in a JTAG chain of interconnected devices, both VCC and VJTAG must remain powered to allow JTAG signals to pass through the device.

VCC can be switched dynamically from 1.2 V to 1.5 V or vice versa. This allows in-system programming (ISP) when VCC is at 1.5 V and the benefit of low power operation when VCC is at 1.2 V.

**VCCIBx****I/O Supply Voltage**

Supply voltage to the bank's I/O output buffers and I/O logic. Bx is the I/O bank number. There are up to eight I/O banks on ProASIC3L low power flash devices plus a dedicated VJTAG bank. Each bank can have a separate VCCI connection. All I/Os in a bank will run off the same VCCIBx supply. VCCI can be 1.2 V, 1.5 V, 1.8 V, 2.5 V, or 3.3 V, nominal voltage. Unused I/O banks should have their corresponding VCCI pins tied to GND.

**VMVx****I/O Supply Voltage (quiet)**

Quiet supply voltage to the input buffers of each I/O bank. x is the bank number. Within the package, the VMV plane biases the input stage of the I/Os in the I/O banks. This minimizes the noise transfer within the package and improves input signal integrity. Each bank must have at least one VMV connection, and no VMV should be left unconnected. All I/Os in a bank run off the same VMVx supply. VMV is used to provide a quiet supply voltage to the input buffers of each I/O bank. VMVx can be 1.2 V, 1.5 V, 1.8 V, 2.5 V, or 3.3 V, nominal voltage. Unused I/O banks should have their corresponding VMV pins tied to GND. VMV and VCCI should be at the same voltage within a given I/O bank. Used VMV pins must be connected to the corresponding VCCI pins of the same bank (i.e., VMV0 to VCCIB0, VMV1 to VCCIB1, etc.).

**VCCPLA/B/C/D/E/F****PLL Supply Voltage**

Supply voltage to analog PLL, nominally 1.5 V or 1.2 V for ProASIC3 devices

When the PLLs are not used, the Designer place-and-route tool automatically disables the unused PLLs to lower power consumption. The user should tie unused VCCPLx and VCOMPLx pins to ground. Microsemi recommends tying VCCPLx to VCC and using proper filtering circuits to decouple VCC noise from the PLLs. Refer to the PLL Power Supply Decoupling section of the "Clock Conditioning Circuits in IGLOO and ProASIC3 Devices" chapter of the [ProASIC3L FPGA Fabric User's Guide](#) for a complete board solution for the PLL analog power supply and ground.

There is one VCCPLF pin on ProASIC3L devices.

**VCOMPLA/B/C/D/E/F****PLL Ground**

Ground to analog PLL power supplies. When the PLLs are not used, the Designer place-and-route tool automatically disables the unused PLLs to lower power consumption. The user should tie unused VCCPLx and VCOMPLx pins to ground.

There is one VCOMPLF pin on ProASIC3L devices.

**VJTAG****JTAG Supply Voltage**

ProASIC3L devices have a separate bank for the dedicated JTAG pins. The JTAG pins can be run at any voltage from 1.5 V to 3.3 V (nominal). Isolating the JTAG power supply in a separate I/O bank gives greater flexibility in supply selection and simplifies power supply and PCB design. If the JTAG interface is neither used nor planned for use, the VJTAG pin together with the TRST pin could be tied to GND. It should be noted that VCC is required to be powered for JTAG operation; VJTAG alone is insufficient. If a device is in a JTAG chain of interconnected boards, the board containing the device can be powered down, provided both VJTAG and VCC to the part remain powered; otherwise, JTAG signals will not be able to transition the device, even in bypass mode.

Microsemi recommends that VPUMP and VJTAG power supplies be kept separate with independent filtering capacitors rather than supplying them from a common rail.

**VPUMP****Programming Supply Voltage**

ProASIC3L devices support single-voltage ISP of the configuration flash and FlashROM. For programming, VPUMP should be 3.3 V nominal. During normal device operation, VPUMP can be left floating or can be tied (pulled up) to any voltage between 0 V and the VPUMP maximum. Programming power supply voltage (VPUMP) range is listed in the datasheet.

When the VPUMP pin is tied to ground, it will shut off the charge pump circuitry, resulting in no sources of oscillation from the charge pump circuitry.

For proper programming, 0.01  $\mu$ F and 0.33  $\mu$ F capacitors (both rated at 16 V) are to be connected in parallel across VPUMP and GND, and positioned as close to the FPGA pins as possible.

Microsemi recommends that VPUMP and VJTAG power supplies be kept separate with independent filtering capacitors rather than supplying them from a common rail.

## User Pins

**I/O****User Input/Output**

The I/O pin functions as an input, output, tristate, or bidirectional buffer. Input and output signal levels are compatible with the I/O standard selected.

During programming, I/Os become tristated and weakly pulled up to VCCI. With VCCI, VMV, and VCC supplies continuously powered up, when the device transitions from programming to operating mode, the I/Os are instantly configured to the desired user configuration.

Unused I/Os are configured as follows:

- Output buffer is disabled (with tristate value of high impedance)
- Input buffer is disabled (with tristate value of high impedance)
- Weak pull-up is programmed

**GL****Globals**

GL I/Os have access to certain clock conditioning circuitry (and the PLL) and/or have direct access to the global network (spines). Additionally, the global I/Os can be used as regular I/Os, since they have identical capabilities. Unused GL pins are configured as inputs with pull-up resistors.

See more detailed descriptions of global I/O connectivity in the "Clock Conditioning Circuits in IGLOO and ProASIC3 Devices" chapter of the [ProASIC3L FPGA Fabric User's Guide](#). All inputs labeled GC/GF are direct inputs into the quadrant clocks. For example, if GAA0 is used for an input, GAA1 and GAA2 are no longer available for input to the quadrant globals. All inputs labeled GC/GF are direct inputs into the chip-level globals, and the rest are connected to the quadrant globals. The inputs to the global network are multiplexed, and only one input can be used as a global input.

Refer to the "I/O Structures in IGLOO and ProASIC3 Devices" chapter of the [ProASIC3L FPGA Fabric User's Guide](#) for an explanation of the naming of global pins.

**FF****Flash\*Freeze Mode Activation Pin**

Flash\*Freeze mode is available on ProASIC3L devices. The FF pin is a dedicated input pin used to enter and exit Flash\*Freeze mode. The FF pin is active low, has the same characteristics as a single-ended I/O, and must meet the maximum rise and fall times. When Flash\*Freeze mode is not used in the design, the FF pin is available as a regular I/O.

When Flash\*Freeze mode is used, the FF pin must not be left floating, to avoid accidentally entering Flash\*Freeze mode. While in Flash\*Freeze mode, the Flash\*Freeze pin should be constantly asserted.

The Flash\*Freeze pin can be used with any single-ended I/O standard supported by the I/O bank in which the pin is located, and input signal levels compatible with the I/O standard selected. The FF pin should be treated as a sensitive asynchronous signal. When defining pin placement and board layout, simultaneously switching outputs (SSOs) and their effects on sensitive asynchronous pins must be considered.

Unused FF or I/O pins are tristated with weak pull-up. This default configuration applies to both Flash\*Freeze mode and normal operation mode. No user intervention is required.

Table 3-1 shows the Flash\*Freeze pin location on the available packages ProASIC3L devices. The Flash\*Freeze pin location is independent of device (except for the PQ208 package), allowing migration to larger or smaller devices while maintaining the same pin location on the board. Refer to the "Flash\*Freeze Technology and Low Power Modes" chapter of the [ProASIC3L FPGA Fabric User's Guide](#) for more information on I/O states during Flash\*Freeze mode.

**Table 3-1 • Flash\*Freeze Pin Location**

| ProASIC3L Package | Flash*Freeze Pin |
|-------------------|------------------|
| VQ100             | 27               |
| FG144             | L3               |
| FG256             | T3               |
| FG324             | R5               |
| FG484             | W6               |
| FG896             | AH4              |
| PQ208             |                  |
| PQ208-A3P250      | 56               |
| PQ208-A3P600L     | 55               |
| PQ208-A3P1000L    | 55               |
| PQ208-A3P3000L    | 58               |

## JTAG Pins

ProASIC3L devices have a separate bank for the dedicated JTAG pins. The JTAG pins can be run at any voltage from 1.5 V to 3.3 V (nominal). VCC must also be powered for the JTAG state machine to operate, even if the device is in bypass mode; VJTAG alone is insufficient. Both VJTAG and VCC to the part must be supplied to allow JTAG signals to transition the device. Isolating the JTAG power supply in a separate I/O bank gives greater flexibility in supply selection and simplifies power supply and PCB design. If the JTAG interface is neither used nor planned for use, the VJTAG pin together with the TRST pin could be tied to GND.

### **TCK** **Test Clock**

Test clock input for JTAG boundary scan, ISP, and UJTAG. The TCK pin does not have an internal pull-up/down resistor. If JTAG is not used, Microsemi recommends tying off TCK to GND through a resistor placed close to the FPGA pin. This prevents JTAG operation in case TMS enters an undesired state.

Note that to operate at all VJTAG voltages, 500  $\Omega$  to 1 k $\Omega$  will satisfy the requirements. Refer to [Table 3-2](#) for more information.

**Table 3-2 • Recommended Tie-Off Values for the TCK and TRST Pins**

| VJTAG          | Tie-Off Resistance           |
|----------------|------------------------------|
| VJTAG at 3.3 V | 200 $\Omega$ to 1 k $\Omega$ |
| VJTAG at 2.5 V | 200 $\Omega$ to 1 k $\Omega$ |
| VJTAG at 1.8 V | 500 $\Omega$ to 1 k $\Omega$ |
| VJTAG at 1.5 V | 500 $\Omega$ to 1 k $\Omega$ |

#### *Notes:*

1. Equivalent parallel resistance if more than one device is on the JTAG chain
2. The TCK pin can be pulled up/down.
3. The TRST pin is pulled down.

### **TDI** **Test Data Input**

Serial input for JTAG boundary scan, ISP, and UJTAG usage. There is an internal weak pull-up resistor on the TDI pin.

### **TDO** **Test Data Output**

Serial output for JTAG boundary scan, ISP, and UJTAG usage.

### **TMS** **Test Mode Select**

The TMS pin controls the use of the IEEE 1532 boundary scan pins (TCK, TDI, TDO, TRST). There is an internal weak pull-up resistor on the TMS pin.

### **TRST** **Boundary Scan Reset Pin**

The TRST pin functions as an active-low input to asynchronously initialize (or reset) the boundary scan circuitry. There is an internal weak pull-up resistor on the TRST pin. If JTAG is not used, an external pull-down resistor could be included to ensure the test access port (TAP) is held in reset mode. The resistor values must be chosen from [Table 3-2](#) and must satisfy the parallel resistance value requirement. The values in [Table 3-2](#) correspond to the resistor recommended when a single device is used, and the equivalent parallel resistor when multiple devices are connected via a JTAG chain.

In critical applications, an upset in the JTAG circuit could allow entrance to an undesired JTAG state. In such cases, Microsemi recommends tying off TRST to GND through a resistor placed close to the FPGA pin.

Note that to operate at all VJTAG voltages, 500  $\Omega$  to 1 k $\Omega$  will satisfy the requirements.

## Special Function Pins

### NC

### No Connect

This pin is not connected to circuitry within the device. These pins can be driven to any voltage or can be left floating with no effect on the operation of the device.

### DC

### Do Not Connect

This pin should not be connected to any signals on the PCB. These pins should be left unconnected.

## Packaging

Semiconductor technology is constantly shrinking in size while growing in capability and functional integration. To enable next-generation silicon technologies, semiconductor packages have also evolved to provide improved performance and flexibility.

Microsemi consistently delivers packages that provide the necessary mechanical and environmental protection to ensure consistent reliability and performance. Microsemi IC packaging technology efficiently supports high-density FPGAs with large-pin-count Ball Grid Arrays (BGAs), but is also flexible enough to accommodate stringent form factor requirements for Chip Scale Packaging (CSP). In addition, Microsemi offers a variety of packages designed to meet your most demanding application and economic requirements for today's embedded and mobile systems.

## 5 – Datasheet Information

### List of Changes

The following table lists critical changes that were made in each version of the ProASIC3L datasheet.

| Revision                        | Changes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Page                                                 |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------|
| Revision 13<br>(January 2013)   | The " <a href="#">ProASIC3L Ordering Information</a> " section has been updated to mention "Y" as "Blank" mentioning "Device Does Not Include License to Implement IP Based on the Cryptography Research, Inc. (CRI) Patent Portfolio" (SAR 43221).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 1-III                                                |
|                                 | Added following notes to <a href="#">Table 2-2 • Recommended Operating Conditions 1</a> :<br>"All ProASIC3L devices must be programmed with the VCC core voltage at 1.5 V" (SAR 39910) and "The programming temperature range supported is Tambient = 0°C to 85°C" (SAR 43645).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 2-2                                                  |
|                                 | The note in <a href="#">Table 2-212 • ProASIC3L CCC/PLL Specification</a> and <a href="#">Table 2-213 • ProASIC3L CCC/PLL Specification</a> referring the reader to SmartGen was revised to refer instead to the online help associated with the core (SAR 42572).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 2-132,<br>2-133                                      |
|                                 | Signal names have been made consistent (SAR 38910).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | NA                                                   |
|                                 | Libero Integrated Design Environment (IDE) was changed to Libero System-on-Chip (SoC) throughout the document (SAR 40286).<br>Live at Power-Up (LAPU) has been replaced with 'Instant On'.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | NA                                                   |
| Revision 12<br>(September 2012) | The " <a href="#">Security</a> " section was modified to clarify that Microsemi does not support read-back of programmed data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 1-2                                                  |
| Revision 11<br>(August 2012)    | Added a Note stating "VMV pins must be connected to the corresponding VCCI pins. See the " <a href="#">VMVx I/O Supply Voltage (quiet)</a> " section on page 3-1 for further information." to <a href="#">Table 2-1 • Absolute Maximum Ratings</a> and <a href="#">Table 2-2 • Recommended Operating Conditions 1</a> (SAR 38316).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 2-1<br>2-2                                           |
|                                 | The " <a href="#">Quiescent Supply Current</a> " section was updated. <a href="#">Table 2-7 • Power Supply State per Mode</a> is new, and <a href="#">Table 2-9 • Quiescent Supply Current (IDD) Characteristics, ProASIC3L Sleep Mode*</a> and <a href="#">Table 2-11 • Quiescent Supply Current (IDD) Characteristics, No Flash*Freeze Mode1</a> were updated for Core Voltage 1.2 V. Notes were also updated for <a href="#">Table 2-9</a> , <a href="#">Table 2-10</a> , and <a href="#">Table 2-11</a> (SAR 34746).                                                                                                                                                                                                                                                                                           | 2-7<br>2-8                                           |
|                                 | The drive strength, IOL, and IOH value for 3.3 V GTL and 2.5 V GTL was changed from 25 mA to 20 mA in the following tables (SAR 37364):<br><a href="#">Table 2-23 • Summary of Maximum and Minimum DC Input and Output Levels Applicable to Commercial and Industrial Conditions—Software Default Settings</a><br><a href="#">Table 2-29 • Summary of I/O Timing Characteristics—Software Default Settings</a><br><a href="#">Table 2-32 • Summary of I/O Timing Characteristics—Software Default Settings</a><br><a href="#">Table 2-36 • I/O Output Buffer Maximum Resistances1</a><br><a href="#">Table 2-40 • I/O Short Currents IOSH/IOSL</a><br><a href="#">Table 2-134 • Minimum and Maximum DC Input and Output Levels</a><br><a href="#">Table 2-138 • Minimum and Maximum DC Input and Output Levels</a> | 2-22<br>2-27<br>2-30<br>2-34<br>2-38<br>2-83<br>2-85 |
|                                 | Also added note stating "Output drive strength is below JEDEC specification." for <a href="#">Tables Table 2-29</a> , <a href="#">Table 2-32</a> , <a href="#">Table 2-36</a> , and <a href="#">Table 2-40</a> .<br>Additionally, the IOL and IOH values for 3.3 V GTL+ and 2.5 V GTL+ were corrected from 51 to 35 (for 3.3 V GTL+) and from 40 to 33 (for 2.5 V GTL+) in <a href="#">table Table 2-23</a> (SAR 39715).                                                                                                                                                                                                                                                                                                                                                                                           |                                                      |

| Revision               | Changes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Page     |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| Revision 11 continued  | Figure 2-12 • AC Loading in the "3.3 V PCI, 3.3 V PCI-X" section was updated to match Table 2-127 • AC Waveforms, Measuring Points, and Capacitive Loads (SAR 34890).                                                                                                                                                                                                                                                                                                                                               | 2-81     |
|                        | In Table 2-180 • Minimum and Maximum DC Input and Output Levels, VIL and VIH were revised so that the maximum is 3.6 V for all listed values of VCCI (SAR 37690).                                                                                                                                                                                                                                                                                                                                                   | 2-103    |
|                        | The following sentence was removed from the "VMVx I/O Supply Voltage (quiet)" section in the "Pin Descriptions and Packaging" chapter: "Within the package, the VMV plane is decoupled from the simultaneous switching noise originating from the output buffer VCCI domain" and replaced with "Within the package, the VMV plane biases the input stage of the I/Os in the I/O banks" (SAR 38316). The datasheet mentions that "VMV pins must be connected to the corresponding VCCI pins" for an ESD enhancement. | 3-1      |
|                        | Pin K15 of the "FG484" pin table for A3P600L was corrected from VvB1 to VCCIB1 (SAR 38788).                                                                                                                                                                                                                                                                                                                                                                                                                         | 4-35     |
| Revision 10 (May 2012) | The "In-System Programming (ISP) and Security" section and "Security" section were revised to clarify that although no existing security measures can give an absolute guarantee, Microsemi FPGAs implement the best security available in the industry (SAR 34670).                                                                                                                                                                                                                                                | I, 1-2   |
|                        | The Y security option and Licensed DPA Logo were added to the "ProASIC3L Ordering Information" section. The trademarked Licensed DPA Logo identifies that a product is covered by a DPA counter-measures license from Cryptography Research (SAR 34728).                                                                                                                                                                                                                                                            | III      |
|                        | The "ProASIC3L Device Status" table was updated to show that all ProASIC3L devices have changed in status from Advance to Production (SAR 38198).                                                                                                                                                                                                                                                                                                                                                                   | IV       |
|                        | The opening sentence of the "General Description" section was revised for clarity to "The ProASIC3L family of Microsemi flash FPGAs dramatically reduces dynamic power consumption by 40% and static power by 50% compared to the equivalent ProASIC3 device" (SAR 22661).                                                                                                                                                                                                                                          | 1-1      |
|                        | The following sentence was removed from the "Advanced Architecture" section:<br>"In addition, extensive on-chip programming circuitry allows for rapid, single-voltage (3.3 V) programming of ProASIC3L devices via an IEEE 1532 JTAG interface" (SAR 34690).                                                                                                                                                                                                                                                       | 1-3      |
|                        | The "Specifying I/O States During Programming" section is new (SAR 34700).                                                                                                                                                                                                                                                                                                                                                                                                                                          | 1-8      |
|                        | Table 1-1 • I/O Standards Supported is new. The "I/Os with Advanced I/O Standards" section was revised to add definitions of hot-swap and cold-sparing (SAR 37732).                                                                                                                                                                                                                                                                                                                                                 | 1-7      |
|                        | In Table 2-2 • Recommended Operating Conditions 1, VPUMP programming voltage for operation was changed from "0 to 3.45 V" to "0 to 3.6 V" (SAR 32257).                                                                                                                                                                                                                                                                                                                                                              | 2-2      |
|                        | Values for 1.5 V were added to Table 2-8 • Quiescent Supply Current (IDD) Characteristics, ProASIC3L Flash*Freeze Mode* and Table 2-11 • Quiescent Supply Current (IDD) Characteristics, No Flash*Freeze Mode1 (SAR 30578).                                                                                                                                                                                                                                                                                         | 2-7, 2-8 |
|                        | The reference to guidelines for global spines and VersaTile rows, given in the "Global Clock Contribution—PCLOCK" section, was corrected to the "Spine Architecture" section of the Global Resources chapter in the ProASIC3L FPGA Fabric User's Guide (SAR 34737).                                                                                                                                                                                                                                                 | 2-15     |
|                        | t <sub>DOUT</sub> was corrected to t <sub>DIN</sub> in Figure 2-4 • Input Buffer Timing Model and Delays (example) (SAR 37110).                                                                                                                                                                                                                                                                                                                                                                                     | 2-19     |

| Revision              | Changes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Page                       |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| Revision 10 continued | 3.3 V LVCMOS and 1.2 V LVCMOS wide range were added to applicable tables in the "Overview of I/O Performance" section and "Detailed I/O DC Characteristics" section. Values for 1.2 V LVCMOS were added to tables in the "Detailed I/O DC Characteristics" section. The "3.3 V LVCMOS Wide Range" section and "1.2 V LVCMOS Wide Range" section, with Minimum and Maximum DC Input and Output Levels tables, are new. Complete timing data for wide range will be available in a later revision of the datasheet (SARs 37161, 38188).                                                                                           | 2-22, 2-33, 2-50, 2-80     |
|                       | The notes regarding drive strength in the "Summary of I/O Timing Characteristics – Default I/O Software Settings" section tables were revised for clarification. They now state that the minimum drive strength for the default software configuration when run in wide range is $\pm 100 \mu\text{A}$ . The drive strength displayed in software is supported in normal range only. For a detailed I/V curve, refer to the IBIS models (SAR 34761).                                                                                                                                                                            | 2-26                       |
|                       | Table 2-39 • I/O Weak Pull-Up/Pull-Down Resistances was updated with additional values and the definitions of $R_{\text{WEAK PULL-UP-MAX}}$ and $R_{\text{WEAK PULL-DOWN-MAX}}$ were corrected (SAR 34756).                                                                                                                                                                                                                                                                                                                                                                                                                     | 2-37                       |
|                       | The paragraph above Table 2-44 • Duration of Short Circuit Event before Failure was revised to change the maximum temperature from 110°C to 100°C, with an example of six months instead of three months. The row for 110°C was removed from the table for consistency with Table 2-2 • Recommended Operating Conditions 1 (SAR 34744).                                                                                                                                                                                                                                                                                         | 2-41                       |
|                       | The AC Loading figures in the "Single-Ended I/O Characteristics" section were updated to match tables in the "Summary of I/O Timing Characteristics – Default I/O Software Settings" section (SAR 34890).                                                                                                                                                                                                                                                                                                                                                                                                                       | 2-42, 2-26                 |
|                       | The following sentence was deleted from the "2.5 V LVCMOS" section (SAR 34797): "It uses a 5 V–tolerant input buffer and push-pull output buffer."                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 2-52                       |
|                       | The table notes were revised for LVDS Table 2-174 • Minimum and Maximum DC Input and Output Levels (SAR 34813).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 2-100                      |
|                       | Values for the maximum frequency for input and output DDR were added to tables in the "DDR Module Specifications" section (SAR 34805).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 2-115                      |
|                       | Minimum pulse width High and Low values were added to the tables in the "Global Tree Timing Characteristics" section. The maximum frequency for global clock parameter was removed from these tables because a frequency on the global is only an indication of what the global network can do. There are other limiters such as the SRAM, I/Os, and PLL. SmartTime software should be used to determine the design frequency (SAR 36965).                                                                                                                                                                                      | 2-128                      |
|                       | Table 2-212 • ProASIC3L CCC/PLL Specification and Table 2-212 • ProASIC3L CCC/PLL Specification were updated. A note was added to indicate that when the CCC/PLL core is generated by Microsemi core generator software, not all delay values of the specified delay increments are available (SAR 34825).                                                                                                                                                                                                                                                                                                                      | 2-132, 2-133               |
|                       | Figure 2-46 • Write Access after Write onto Same Address, Figure 2-47 • Read Access after Write onto Same Address, and Figure 2-48 • Write Access after Read onto Same Address were deleted. Reference was made to a new application note, <i>Simultaneous Read-Write Operations in Dual-Port SRAM for Flash-Based cSoCs and FPGAs</i> , which covers these cases in detail (SAR 34873).<br>The port names in the SRAM "Timing Waveforms", SRAM "Timing Characteristics" tables, Figure 2-50 • FIFO Reset, and the FIFO "Timing Characteristics" tables were revised to ensure consistency with the software names (SAR 35751). | 2-135, 2-138, 2-144, 2-146 |
|                       | Figure 2-48 • FIFO Read and Figure 2-49 • FIFO Write are new (SAR 34849).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 2-143                      |
|                       | The "Pin Descriptions and Packaging" chapter is new (SAR 34773).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 3-1                        |

| Revision                   | Changes                                                                                                                                                                                                                                                                        | Page |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|
| Revision 10<br>(continued) | Package names used in the <a href="#">"Package Pin Assignments" section</a> were revised to match standards given in <a href="#">Package Mechanical Drawings</a> (SAR 34773).                                                                                                  | 4-1  |
| July 2010                  | The versioning system for datasheets has been changed. Datasheets are assigned a revision number that increments each time the datasheet is revised. The <a href="#">"ProASIC3L Device Status" table on page IV</a> indicates the status for each device in the device family. | N/A  |

| Revision                                                                                               | Changes                                                                                                                                                                                                                                                                                                                                                       | Page         |

| <b>Revision 4 (June 2008)</b><br>DC and Switching Characteristics<br>Advance v0.3 | Tables have been updated to include the LVCMOS 1.2 V I/O set.                                                                                                                                                                                                                                                                                                                                                                               | N/A                     |
|                                                                                   | DDR Tables have two additional data points added to reflect both edges for Input<br>DDR setup and hold time.<br>Power data table has been updated to match SmartPower data rather than<br>simulation values.                                                                                                                                                                                                                                |                         |
|                                                                                   | Table 2-1 • Absolute Maximum Ratings was updated to add VMV to the VCCI parameter row and to remove the word "output" from the parameter description for VCCI. Table note 3 was added.                                                                                                                                                                                                                                                      | 2-1                     |
|                                                                                   | Table 2-2 • Recommended Operating Conditions 1 was updated to add table note references and rearrange the order of notes. VMV was added to the VCCI parameter row. A new row was added for VCC, 1.5 V DC core supply voltage. The table note stating that 1.5 V data will be released at a later date is new. The table note on VMV pins is new.                                                                                            | 2-2                     |
|                                                                                   | Table 2-4 • Overshoot and Undershoot Limits 1. The title was revised to remove "as measured on quiet I/Os." Table note 2 was revised to remove "estimated SSO density over cycles." Table note 3 was revised to remove "refers only to overshoot/undershoot limits for simultaneous switching I/Os."                                                                                                                                        | 2-3                     |
|                                                                                   | EQ 2 was updated. The temperature was changed to 100°C, and therefore the end result changed.                                                                                                                                                                                                                                                                                                                                               | 2-6                     |
|                                                                                   | The table notes for Table 2-8 • Quiescent Supply Current (IDD) Characteristics, ProASIC3L Flash*Freeze Mode* and Table 2-9 • Quiescent Supply Current (IDD) Characteristics, ProASIC3L Sleep Mode* were updated to remove VMV and include P <sub>DC6</sub> and P <sub>DC7</sub> . The table note for Table 2-8 • Quiescent Supply Current (IDD) Characteristics, ProASIC3L Flash*Freeze Mode* was updated to include VJTAG.                 | 2-7                     |
|                                                                                   | Table 2-10 • Quiescent Supply Current (IDD) Characteristics, Shutdown Mode is new.                                                                                                                                                                                                                                                                                                                                                          | 2-8                     |
|                                                                                   | Note 2 of Table 2-11 • Quiescent Supply Current (IDD) Characteristics, No Flash*Freeze Mode1 was updated to include VCCPLL. Note 4 was updated to include PDC6 and PDC7.                                                                                                                                                                                                                                                                    | 2-8                     |
|                                                                                   | Table 2-12 • Summary of I/O Input Buffer Power (per pin) – Default I/O Software Settings through Table 2-17 • Summary of I/O Output Buffer Power (per pin) – Default I/O Software Settings 1 were updated to change PDC2 to PDC6 and PDC3 to PDC7. The table notes were updated to reflect that power was measured on VCCI. The subtitle of the table was changed from "Applicable to Advanced I/O Banks" to "Applicable to Pro I/O Banks." | 2-9<br>through<br>2-12  |
|                                                                                   | The word "input" in the titles of Table 2-15 • Summary of I/O Output Buffer Power (per pin) – Default I/O Software Settings 1 and Table 2-16 • Summary of I/O Output Buffer Power (per pin) – Default I/O Software Settings 1, was changed to "output."                                                                                                                                                                                     | 2-11, 2-12              |
|                                                                                   | The value of C <sub>LOAD</sub> for single-ended 3.3 V PCI was changed to 10 from 5 in Table 2-15 • Summary of I/O Output Buffer Power (per pin) – Default I/O Software Settings 1 through Table 2-17 • Summary of I/O Output Buffer Power (per pin) – Default I/O Software Settings 1.                                                                                                                                                      | 2-11<br>through<br>2-12 |

| Revision                                                                             | Changes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Page           |
|--------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|
| <b>Revision 4 (cont'd)</b>                                                           | The last section of <a href="#">Table 2-18 • Different Components Contributing to Dynamic Power Consumption in ProASIC3L Devices at 1.2 V VCC</a> was made into a new table: <a href="#">Table 2-19 • Different Components Contributing to Dynamic Power Consumption in ProASIC3L Devices at 1.5 V VCC</a> . The table numbers referenced for device-specific dynamic power for $P_{AC9}$ and $P_{AC10}$ were changed in <a href="#">Table 2-18 • Different Components Contributing to Dynamic Power Consumption in ProASIC3L Devices at 1.2 V VCC</a> . The definition of $P_{DC5}$ was updated and parameters $P_{DC6}$ and $P_{DC7}$ were added to <a href="#">Table 2-20 • Different Components Contributing to the Static Power Consumption in ProASIC3L Devices</a> . | 2-13           |
|                                                                                      | The "Total Static Power Consumption—PSTAT" section was updated to revise the calculation of $P_{STAT}$ , including $P_{DC6}$ and $P_{DC7}$ .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 2-15           |
|                                                                                      | <a href="#">Footnote 1</a> was updated to include information about $P_{AC13}$ .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | 2-16           |
|                                                                                      | <a href="#">Table 2-43 • Schmitt Trigger Input Hysteresis, Hysteresis Voltage Value (Typ) for Schmitt Mode Input Buffers</a> was updated to include the hysteresis value for 1.2 V LVCMOS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 2-40           |

| <b>Revision 3 (Apr 2008)</b><br>Product Brief v1.0                                   | The product brief was divided into two sections and given a version number, starting at v1.0. The first section of the document includes features, benefits, ordering information, and temperature and speed grade offerings. The second section is a device family overview.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | N/A            |
| Packaging v1.1                                                                       | The "FG324" package diagram was replaced.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 4-29           |
| <b>Revision 2 (Apr 2008)</b><br>Product Brief rev. 1                                 | Reference to M1A3P250L was removed from <a href="#">Table 1 • ProASIC3 Low-Power Product Family</a> , the "I/Os Per Package 1" table, the "ProASIC3L Ordering Information" section, and the "Temperature Grade Offerings" table. The table note regarding M1A3P250L was removed from the "I/Os Per Package 1" table.                                                                                                                                                                                                                                                                                                                                                                                                                                                        | I, II, III, IV |
| <b>Revision 1 (Feb 2008)</b><br><br>DC and Switching Characteristics<br>Advance v0.2 | The "PLL Behavior at Brownout Condition" section is new.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 2-4            |
|                                                                                      | <a href="#">Table 2-204 • A3P250L Global Resource – Applies to 1.5 V DC Core Voltage</a> , <a href="#">Table 2-206 • A3P600L Global Resource – Applies to 1.5 V DC Core Voltage</a> , <a href="#">Table 2-208 • A3P1000L Global Resource – Applies to 1.5 V DC Core Voltage</a> , and <a href="#">Table 2-210 • A3PE3000L Global Resource – Applies to 1.5 V DC Core Voltage</a> were updated with values for $t_{RCKL}$ , $t_{RCKH}$ , and $t_{RCKSW}$ .                                                                                                                                                                                                                                                                                                                   | 2-128 – 2-131  |
|                                                                                      | The worst-case commercial conditions were added to <a href="#">Table 2-221 • Embedded FlashROM Access Time—Applies to 1.2 V DC Core Voltage</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 2-148          |
|                                                                                      | <a href="#">Table 2-18 • Different Components Contributing to Dynamic Power Consumption in ProASIC3L Devices at 1.2 V VCC</a> was updated to revise the value for $P_{AC14}$ and add parameters $P_{DC1}$ through $P_{DC5}$ to the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 2-13           |

## Datasheet Categories

### **Categories**

In order to provide the latest information to designers, some datasheet parameters are published before data has been fully characterized from silicon devices. The data provided for a given device, as highlighted in the "ProASIC3L Device Status" table on page IV, is designated as either "Product Brief," "Advance," "Preliminary," or "Production." The definitions of these categories are as follows:

#### **Product Brief**

The product brief is a summarized version of a datasheet (advance or production) and contains general product information. This document gives an overview of specific device and family information.

#### **Advance**

This version contains initial estimated information based on simulation, other products, devices, or speed grades. This information can be used as estimates, but not for production. This label only applies to the DC and Switching Characteristics chapter of the datasheet and will only be used when the data has not been fully characterized.

#### **Preliminary**

The datasheet contains information based on simulation and/or initial characterization. The information is believed to be correct, but changes are possible.

#### **Production**

This version contains information that is considered to be final.

### **Export Administration Regulations (EAR)**

The products described in this document are subject to the Export Administration Regulations (EAR). They could require an approved export license prior to export from the United States. An export includes release of product or disclosure of technology to a foreign national inside or outside the United States.

## Safety Critical, Life Support, and High-Reliability Applications Policy

The products described in this advance status document may not have completed the Microsemi qualification process. Products may be amended or enhanced during the product introduction and qualification process, resulting in changes in device functionality or performance. It is the responsibility of each customer to ensure the fitness of any product (but especially a new product) for a particular purpose, including appropriateness for safety-critical, life-support, and other high-reliability applications. Consult the Microsemi SoC Products Group Terms and Conditions for specific liability exclusions relating to life-support applications. A reliability report covering all of the SoC Products Group's products is available at [http://www.microsemi.com/soc/documents/ORT\\_Report.pdf](http://www.microsemi.com/soc/documents/ORT_Report.pdf). Microsemi also offers a variety of enhanced qualification and lot acceptance screening procedures. Contact your local sales office for additional reliability information.

Microsemi Corporation (NASDAQ: MSCC) offers a comprehensive portfolio of semiconductor solutions for: aerospace, defense and security; enterprise and communications; and industrial and alternative energy markets. Products include high-performance, high-reliability analog and RF devices, mixed signal and RF integrated circuits, customizable SoCs, FPGAs, and complete subsystems. Microsemi is headquartered in Aliso Viejo, Calif. Learn more at [www.microsemi.com](http://www.microsemi.com).
