

800MHz to 2.7GHz RF Measuring Receiver

January 2002

FEATURES

RF Frequency Range: 800MHz to 2.7GHz
Ultra Wide Dynamic Range: 80dB Over Full Frequency Range and Over Temperature

■ Wide Power Supply Range: 2.7V to 5.25V

Low Supply Current: 14.7mA at 3V

Shutdown Current: 0.2μA8-Lead MS0P Package

APPLICATIONS

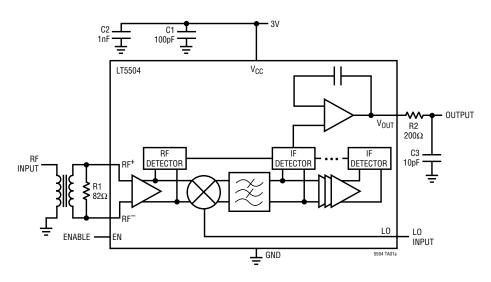

- RSSI Measurements
- Receive AGC
- Transmit Power Control
- ASK and Envelope Demodulation
- GSM/TDMA/CDMA/WCDMA

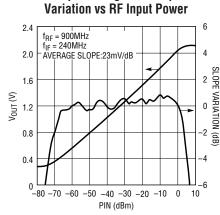

DESCRIPTION

The LT®5504 is an 800MHz to 2700MHz monolithic integrated measuring receiver, capable of detecting a wide dynamic range RF signal from -75dBm to +5dBm. The logarithm of the RF signal is precisely converted into a linear DC voltage. The LT5504 consists of RF/IF limiters, an LO buffer amplifier, a limiting mixer, a 3rd-order 450MHz integrated low pass filter, RF/IF detectors and an output interface. The ultrawide dynamic range is achieved by simultaneously measuring the RF signal and a down-converted IF signal obtained using the on-chip mixer and an external local oscillator. The RF- and IF-detected signals are summed to generate an accurate linear DC voltage proportional to the input RF voltage (or power) in dB. The output is buffered with a low output impedance driver.

LT, LTC and LT are registered trademarks of Linear Technology Corporation.

Note 1: Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

Note 2: Tests are performed as shown in the configuration of Figure 5.

Note 3: Specifications over the -40° C to 85° C temperature range are guaranteed by design, characterization and correlation with statistical process controls.

Note 4: The Linear Dynamic Range is defined as the range over which the output slope is at least 50% of the average slope from -50dBm to -20dBm.

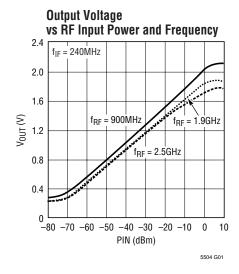

Note 5: The output voltage is settled to the full specification within 1dB.

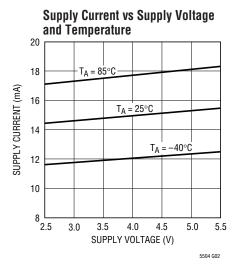

Note 6: Refer to Figure 1 and Applications Information.

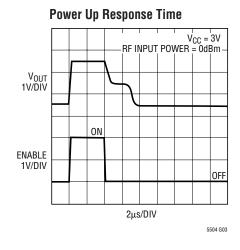

Note 7: Refer to Pin Functions description.

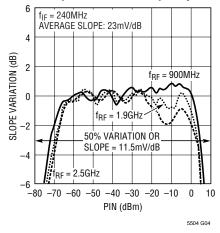

TYPICAL PERFORMANCE CHARACTERISTICS

PIN FUNCTIONS

V_{CC} (**Pins 1, 8**): Power Supply Pins. These pins must be tied together at the part as close as possible, and should be decoupled using 1000pF capacitors.

RF+ (Pin 2): Positive RF Input Pin.

RF⁻ (Pin 3): Negative RF Input Pin.

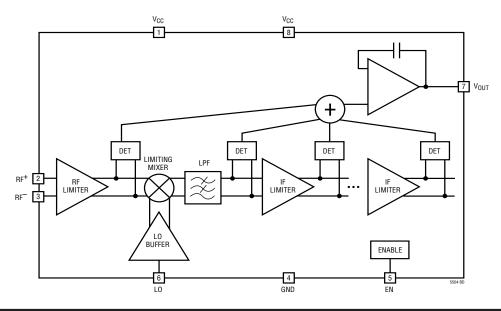

GND (Pin 4): Ground Pin.

EN (Pin 5): Enable Pin. The on/off threshold voltage is about $V_{CC}/2$. When the input voltage is higher than $0.6 \cdot V_{CC}$, the circuit is completely turned on. When the input voltage is less than $0.4 \cdot V_{CC}$, the circuit is turned off.

LO (Pin 6): Local Oscillator Input Pin.

Vout (Pin 7): Output Pin.

APPLICATIONS INFORMATION

The LT5504 consists of the following sections: RF/IF limiters, limiting mixer, RF/IF detectors, LO buffer amplifier, 3rd-order integrated low pass filter (LPF), output interface and bias circuitry.

An RF signal ranging from 800MHz to 2.7GHz is detected by the RF and IF detectors using a proprietary technique. The down-converted IF signal is band limited by the onchip LPF, reducing broadband noise, and thus an ultrawide dynamic range signal can be measured. The RF measuring receiver is essentially a logarithmic voltage detector. The measured output voltage is directly proportional to the RF signal voltage. An internal temperature compensation circuit results in a highly temperature-stable output voltage.

RF Limiter

The differential input impedance of the RF limiter is shown in Figure 1. A 1:1 input transformer can be used to achieve 50Ω broadband matching with an 82Ω shunt resistor (R1) at the inputs as shown in Figure 5.

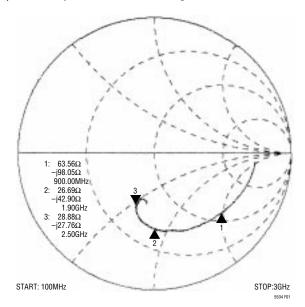

Figure 1. Differential RF Input Impedance

The 1:1 RF input transformer can also be replaced with a narrow band single-ended-to-differential conversion circuit using three discrete elements as shown in Figure 2. Their nominal values are listed in Table 1. Due to the parasitics of the PCB, these values may require adjustment.

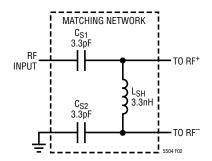

Figure 2. RF Input Matching Network at 1900MHz

Figure 3 shows the output voltage vs RF input power response for these two input terminations. The voltage gain of the single-ended-to-differential conversion circuit is:

$$GAIN = 20 \bullet LOG \sqrt{\frac{R_{IN}}{50}} = 3dB,$$

where $R_{IN} = 100\Omega$ is the narrow band input impedance.

Thus, the output voltage curve in this case is shifted to the left by about 3dB.

Table 1. The Component Values of Matching Network L $_{SH},\,C_{S1}$ and C_{S2}

-02			
f _{IF} (MHz)	L _{SH} (nH)	$C_{S1}/C_{S2}(pF)$	
900	12.0	3.9	
1900	3.3	3.3	
2500	2.7	2.2	
2700	2.4	1.5

LINEAR TECHNOLOGY

APPLICATIONS INFORMATION

Limiting Mixer and LPF

The amplified RF signal is down-converted using the limiting mixer and LO signal. The resulting signal is filtered by the 3rd-order, 450MHz, integrated low pass filter (LPF). Only the desired IF signal is passed to the IF limiters for further detection. Any other mixing products, including LO feedthrough, are much reduced to maximize sensitivity. The receiver's sensitivity is thus defined by the LPF bandwidth.

IF Limiter

The IF signal is then amplified through the multiple limiter stages for further signal detection. All DC offsets, including LO signal self-mixing, are eliminated by an internal DC offset cancellation circuit. Nevertheless, care should be taken in component placement and in PCB layout to minimize LO coupling to the RF port.

Output Interface

The output interface of the LT5504 is shown in Figure 4. The output currents from the RF and IF detectors are summed and converted into an output voltage, $V_{OUT}.$ The maximum charging current available to the output load is about $400\mu A.$ An internal compensation capacitor C_C is used to guarantee stable operation for a large capacitive output load. The slew rate is $80V/\mu s$ and the small signal output bandwidth is approximately 5MHz when the output is resistively terminated. When the output

is loaded with a large capacitor C_L , the slew rate is limited to $400\mu A/C_L$. For example, the slew rate is reduced to $4V/\mu S$ when $C_L = 100 pF$.

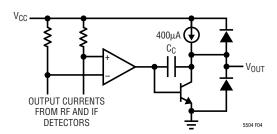

Figure 4. Simplified Circuit Schematic of the Output Interface

Applications

The LT5504 can be used as a self-standing signal strength-measuring receiver (RSSI) for a wide range of input signals from – 75dBm to +5dBm, for frequencies from 800MHz to 2.7GHz.

The LT5504 can be used as a demodulator for AM and ASK modulated signals with data rates up to 5MHz. Depending on specific application needs, the RSSI output can be split into two branches, providing AC coupled data output, and DC coupled, RSSI output for signal strength measurements and AGC. Refer to Figure 5.

The LT5504 can also be used as a wide range RF power detector for transmit power control.
