description

The TMS4xx400 is a set of high-speed, 16 777 216-bit dynamic random-access memories organized as 4 194 304 words of 4 bits each. The TMS4xx400P series are high-speed, low-power, self-refresh, 16 777 216-bit dynamic random-access memories organized as 4 194 304 words of 4 bits each. The TMS4xx400 and TMS4xx400P employ state-of-the-art EPIC™ (Enhanced Performance Implanted CMOS) technology for high performance, reliability, and low power.

These devices feature maximum $\overline{\text{RAS}}$ access times of 60 ns, 70 ns, and 80 ns. All addresses and data-in lines are latched on-chip to simplify system design. Data out is unlatched to allow greater system flexibility.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

EPIC is a trademark of Texas Instruments Incorporated.

UNLESS OTHERWISE NOTED this document contains PRODUCTION DATA information current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

POST OFFICE BOX 1443 • HOUSTON, TEXAS 77251-1443

description (continued)

The TMS4xx400 and TMS4xx400P are each offered in a 24/26-lead plastic surface-mount TSOP (DGA suffix) package and a 24/26-lead plastic surface-mount SOJ (DJ suffix) package. These packages are characterized for operation from 0°C to 70°C.

operation

enhanced page mode

Enhanced page-mode operation allows faster memory access by keeping the same row address while selecting random column addresses. The time for row-address setup and hold and address multiplex is eliminated. The maximum number of columns that can be accessed is determined by t_{RASP} , the maximum $\overline{RAS}$ low time.

Unlike conventional page-mode DRAMs, the column-address buffers in these devices are activated on the falling edge of $\overline{RAS}$. The buffers act as transparent or flow-through latches while $\overline{CAS}$ is high. The falling edge of $\overline{CAS}$ latches the column addresses and enables the output. This feature allows the devices to operate at a higher data bandwidth than conventional page-mode parts because data retrieval begins as soon as the column address is valid rather than when $\overline{CAS}$ transitions low. This performance improvement is referred to as enhanced page mode. A valid column address can be presented immediately after row-address hold time has been satisfied, usually well in advance of the falling edge of $\overline{CAS}$. In this case, data is obtained after t_{CAC} max (access time from $\overline{CAS}$ low) if t_{AA} max (access time from column address) and t_{RAC} have been satisfied. In the event that column address for the next cycle is valid at the time $\overline{CAS}$ goes high, access time for the next cycle is determined by the later occurrence of t_{CPA} or t_{CAC} .

address: A0–A11 (TMS4x6400/P) and A0–A10 (TMS4x7400/P)

Twenty-two address bits are required to decode 1 of 4 194 304 storage cell locations. For the TMS4x6400 and TMS4x6400P, 12 row-address bits are set up on A0 through A11 and latched onto the chip by the row-address strobe ($\overline{RAS}$). Ten column-address bits are set up on A0 through A9. For TMS4x7400 and TMS4x7400P, 11 row-address bits are set up on inputs A0 through A10 and latched onto the chip by $\overline{RAS}$. Eleven column-address bits are set up on A0 through A10. All addresses must be stable on or before the falling edge of $\overline{RAS}$ and $\overline{CAS}$. $\overline{RAS}$ is similar to a chip enable because it activates the sense amplifiers as well as the row decoder. $\overline{CAS}$ is used as a chip select, activating the output buffers and latching the address bits into the column-address buffers.

write enable ($\overline{W}$)

The read or write mode is selected through $\overline{W}$. A logic high on $\overline{W}$ selects the read mode, and a logic low selects the write mode. The data inputs are disabled when the read mode is selected. When $\overline{W}$ goes low prior to $\overline{CAS}$ (early write), data out remains in the high-impedance state for the entire cycle, permitting a write operation with $\overline{OE}$ grounded.

data in (DQ1–DQ4)

Data is written during a write or read-modify-write cycle. Depending on the mode of operation, the falling edge of $\overline{CAS}$ or $\overline{W}$ strobes data into the on-chip data latch. In an early-write cycle, $\overline{W}$ is brought low prior to $\overline{CAS}$, and the data is strobed in by $\overline{CAS}$ with setup and hold times referenced to this signal. In a delayed-write or read-modify-write cycle, $\overline{CAS}$ is already low, and the data is strobed in by $\overline{W}$ with setup and hold time referenced to this signal. In a delayed-write or read-modify-write cycle, $\overline{OE}$ must be high to bring the output buffers to the high-impedance state prior to impressing data on the I/O lines.

data out (DQ1–DQ4)

Data out is the same polarity as data in. The output is in the high-impedance (floating) state until $\overline{CAS}$ and $\overline{OE}$ are brought low. In a read cycle, the output becomes valid after the access time interval t_{CAC} (which begins with the negative transition of $\overline{CAS}$) as long as t_{RAC} and t_{AA} are satisfied.

$\overline{\text{RAS}}$ -only refresh

TMS4x6400, TMS4x6400P

A refresh operation must be performed at least once every 64 ms (128 ms for TMS4x6400P) to retain data. This can be achieved by strobing each of the 4096 rows (A0–A11). A normal read or write cycle refreshes all bits in each row that is selected. A $\overline{\text{RAS}}$ -only operation can be used by holding $\overline{\text{CAS}}$ at the high (inactive) level, conserving power as the output buffers remain in the high-impedance state. Externally generated addresses must be used for a $\overline{\text{RAS}}$ -only refresh.

TMS4x7400, TMS4x7400P

A refresh operation must be performed at least once every 32 ms (128 ms for TMS4x7400P) to retain data. This can be achieved by strobing each of the 2048 rows (A0–A10). A normal read or write cycle refreshes all bits in each row that is selected. A $\overline{\text{RAS}}$ -only operation can be used by holding $\overline{\text{CAS}}$ at the high (inactive) level, conserving power as the output buffers remain in the high-impedance state. Externally generated addresses must be used for a $\overline{\text{RAS}}$ -only refresh.

hidden refresh

Hidden refresh can be performed while maintaining valid data at the output pin. This is accomplished by holding $\overline{\text{CAS}}$ at V_{IL} after a read operation and cycling $\overline{\text{RAS}}$ after a specified precharge period, similar to a $\overline{\text{RAS}}$ -only refresh cycle. The external address is ignored, and the refresh address is generated internally.

$\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ (CBR) refresh

CBR refresh is utilized by bringing $\overline{\text{CAS}}$ low earlier than $\overline{\text{RAS}}$ (see parameter t_{CSR}) and holding it low after $\overline{\text{RAS}}$ falls (see parameter t_{CHR}). For successive CBR refresh cycles, $\overline{\text{CAS}}$ can remain low while cycling $\overline{\text{RAS}}$. The external address is ignored, and the refresh address is generated internally.

battery-backup refresh

TMS4x6400P

A low-power battery-backup refresh mode that requires less than 500 μA (5 V) or 350 μA (3.3 V) refresh current is available on the TMS4x6400P. Data integrity is maintained using CBR refresh with a period of 31.25 μs while holding $\overline{\text{RAS}}$ low for less than 1 μs . To minimize current consumption, all input levels must be at CMOS levels ($V_{IL} < 0.2 \text{ V}$, $V_{IH} > V_{CC} - 0.2 \text{ V}$).

TMS4x7400P

A low-power battery-backup refresh mode that requires less than 500 μA (5 V) or 350 μA (3.3 V) refresh current is available on the TMS4x7400P. Data integrity is maintained using CBR refresh with a period of 62.5 μs while holding $\overline{\text{RAS}}$ low for less than 1 μs . To minimize current consumption, all input levels must be at CMOS levels ($V_{IL} < 0.2 \text{ V}$, $V_{IH} > V_{CC} - 0.2 \text{ V}$).

self refresh (TMS4xx400P)

The self-refresh mode is entered by dropping $\overline{\text{CAS}}$ low prior to $\overline{\text{RAS}}$ going low. Then $\overline{\text{CAS}}$ and $\overline{\text{RAS}}$ are both held low for a minimum of 100 μs . The chip is then refreshed internally by an on-board oscillator. No external address is required because the CBR counter is used to keep track of the address. To exit the self-refresh mode, both $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$ are brought high to satisfy t_{CHS} . Upon exiting self-refresh mode, a burst refresh (refresh a full set of row addresses) must be executed before continuing with normal operation. The burst refresh ensures the DRAM is fully refreshed.

power up

To achieve proper device operation, an initial pause of 200 μs followed by a minimum of eight initialization cycles is required after power up to the full V_{CC} level. These eight initialization cycles must include at least one refresh ($\overline{\text{RAS}}$ -only or CBR) cycle.

test mode

The test mode is initiated with a CBR-refresh cycle while simultaneously holding the $\overline{W}$ input low. The entry cycle performs an internal refresh cycle while internally setting the device to perform parallel read or write on subsequent cycles. While in the test mode, any data sequence can be performed. The device exits test mode if a CBR refresh cycle with $\overline{W}$ held high or a $\overline{RAS}$ -only refresh cycle is performed.

In the test mode, the device is configured as 1024K bits $\times$ 4 bits for each DQ. Each DQ pin has a separate 4-bit parallel read and write data bus that ignores column addresses A0 and A1. During a read cycle, the four internal bits are compared for each DQ pin separately. If the four bits agree, DQ goes high; if not, DQ goes low. During a write cycle, the data states of all four DQs must be the same to ensure proper function of the test mode. Test time is reduced by a factor of four for this series.

NOTE A: The states of $\overline{W}$, data in, and address are defined by the type of cycle used during test mode.

IMPORTANT NOTICE

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgement, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

CERTAIN APPLICATIONS USING SEMICONDUCTOR PRODUCTS MAY INVOLVE POTENTIAL RISKS OF DEATH, PERSONAL INJURY, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE ("CRITICAL APPLICATIONS"). TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS. INCLUSION OF TI PRODUCTS IN SUCH APPLICATIONS IS UNDERSTOOD TO BE FULLY AT THE CUSTOMER'S RISK.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used. TI's publication of information regarding any third party's products or services does not constitute TI's approval, warranty or endorsement thereof.
