

# DAC1208D650

Dual 12-bit DAC; up to 650 Msps; 2×, 4× or 8× interpolating with JESD204A interface

Rev. 04 — 2 July 2012

Product data sheet

## 1. General description

The DAC1208D650 is a high-speed 12-bit dual channel Digital-to-Analog Converter (DAC) with selectable 2×, 4× or 8× interpolating filters optimized for multi-carrier WCDMA transmitters.

Because of its digital on-chip modulation, the DAC1208D650 allows the complex pattern provided through lane 0, lane 1, lane 2 and lane 3, to be converted up from baseband to IF. The mixing frequency is adjusted via a Serial Peripheral Interface (SPI) with a 32-bit Numerically Controlled Oscillator (NCO) and the phase is controlled by a 16-bit register.

The DAC1208D650 also includes a 2×, 4× or 8× clock multiplier which provides the appropriate internal clocks and an internal regulation to adjust the output full-scale current.

The input data format is serial according to JESD204A specification. This new interface has numerous advantages over the traditional parallel one: easy PCB layout, lower radiated noise, lower pin count, self-synchronous link, skew compensation. The maximum number of lanes of the DAC1208D650 is 4 and its maximum serial data rate is 3.125 Gbps.

The Multiple Device Synchronization (MDS) guarantees maximum skew of one output clock period between several DAC devices. MDS incorporates modes: Master/slave and All slave mode.

## 2. Features and benefits

- Dual 12-bit resolution
- 650 Msps maximum update rate
- Selectable 2×, 4× or 8× interpolation filters
- Input data rate up to 312.5 Msps
- Very low-noise cap-free integrated PLL
- 32-bit programmable NCO frequency
- Four JESD204A serial input lanes
- 1.8 V and 3.3 V power supplies
- LVDS compatible clock inputs
- IMD3: 80 dBc;  $f_s = 640$  Msps;  $f_o = 140$  MHz
- ACPR: 71 dBc; two carriers WCDMA;  $f_s = 640$  Msps;  $f_o = 133$  MHz
- Typical 1.22 W power dissipation at 4× interpolation, PLL off and 640 Msps
- Power-down mode and Sleep modes
- Differential scalable output current from 1.6 mA to 22 mA
- On-chip 1.29 V reference
- External analog offset control (10-bit auxiliary DACs)
- Internal digital offset control
- Inverse (sin x) / x function

- Two's complement or binary offset data format
- LMF = 421 or LMF = 211 support
- Differential CML receiver with embedded termination
- Synchronization of multiple DAC outputs
- Fully compatible SPI port
- Industrial temperature range from –40 °C to +85 °C
- Integrated PLL can be bypassed
- Embedded complex modulator

### 3. Applications

- Wireless infrastructure: LTE, WiMAX, GSM, CDMA, WCDMA, TD-SCDMA
- Communication: LMDS/MMDS, point-to-point
- Direct Digital Synthesis (DDS)
- Broadband wireless systems
- Digital radio links
- Instrumentation
- Automated Test Equipment (ATE)

## 10. Application information

### 10.1 General description

The DAC1208D650 is a dual 12-bit DAC operating up to 650 Msps. With a maximum input data rate of up to 312.5 Msps and a maximum output sampling rate of 650 Msps, the DAC1208D650 allows more flexibility for wide bandwidth and multi-carrier systems. Combined with its quadrature modulator and 32-bit NCO, the DAC1208D650 simplifies the frequency selection of the system. This is also possible because of the 2×, 4× or 8× interpolation filters which remove undesired images.

DAC1208D650 supports the following JESD204A key features:

- 10-bit/8-bit decoding
- Code group synchronization
- inter-lane alignment
- $1 + x^{14} + x^{15}$  scrambling polynomial
- Character replacement
- TX/RX synchronization management via sync signals
- Multiple Converter Device Alignment-Multiple Lanes (MCDA-ML) device

DAC1208D650 can be interfaced with any logic device that features high-speed SERDES functionality. This macro is now widely available in FPGA from different vendors. Standalone SERDES ICs can also be used.

To enhance the intrinsic board layout simplification of the JESD204A standard, IDT includes polarity swapping for each of the lanes and additionally offers lane swapping. Each physical lane can be configured logically as lane0, lane1, lane2 or lane3.

This device is MCDA-ML compliant, offering inter-lane alignment between several devices. Samples alignment between devices is maintained up to output level because of an IDT proprietary mechanism. One device is configured as the master and all the others are configured as slaves. These will automatically align their output samples to the master ones. Therefore, a system with several DAC1208D650s can produce data with a guaranteed alignment of less than 1 DAC output clock period.

Each DAC generates two complementary current outputs on pins IOUTAP/IOUTAN and IOUTBP/IOUTBN. This provides a full-scale output current of up to 20 mA. An internal reference is available for the reference current which is externally adjustable using pin VIRES.

The DAC1208D650 must be configured before operating. Therefore, it features an SPI slave interface to access internal registers. Some of these registers also provide information about the JESD204A interface status.

The DAC1208D650 requires supplies of both 3.3 V and 1.8 V. The 1.8 V supply has separate digital and analog power supply pins. The clock input is LVDS compliant.

10.2 JESD204A receiver

The JEDEC204A defines the following parameters:

- L is the number of lanes per link
- M is the number of converters per device
- F is the number of bytes per frame clock period

The DAC1208D650 supports both LMF = 421 and LMF = 211. The current setting is configurable via the SPI registers interface.

The complete Digital Layer Processing (DLP) adds a variable delay on each lane path. This is mainly because of the inter-lane alignment.

Table 6. Digital Layer Processing Latency

| Symbol         | Parameter  | Conditions                     | Test <sup>[1]</sup> | Min | Typ | Max | Unit                 |
|----------------|------------|--------------------------------|---------------------|-----|-----|-----|----------------------|
| t <sub>d</sub> | delay time | digital layer processing delay | D                   | 13  | -   | 28  | cycle <sup>[2]</sup> |

[1] D = guaranteed by design.

[2] Frame clock cycle.

### 10.2.1 Lane input

Each lane is CML compliant. It is terminated to a common voltage with an integrated 50  $\Omega$  resistor.

The common-mode voltage is programmable by the SET\_VCM\_VOLTAGE register as shown in Table 75 on page 55.

DC coupling is only possible if both the DAC and the transmitter have the same common-mode voltage. If this is not the case AC coupling is required.

The deserializer performs the incoming data clock recovery and also the serial-to-parallel conversion. Therefore, each lane includes its own PLL that must first lock.

The clock alignment module transfers the data from the regenerated clock to the frame clock domain. The frequency of both clocks is the same but the phase relationship between the clocks is unknown.

### 10.2.2 Sync and word align

As stated in JESD204A, the transmitter and the receiver first have to synchronize. This is achieved through SYNC\_OUT signals and a sync pattern (K28.5 symbol). The receiver (i.e. DAC1208D650) first drives its SYNC\_OUT outputs. The sync pattern is continuously sent until the receiver deasserts the SYNC\_OUT signal.

The lane processing makes use of the sync patterns to synchronize the data stream, determine the initial running disparity and extract the 10-bit word from the incoming data stream (word-alignment).

The SYNC\_OUT signal is also used during normal operation by the DAC1208D650 to request a link reinitialization. This occurs when the 10b/8b module loses synchronization.

The SYNC\_OUT signal conforms to LVDS signaling. Its common-mode voltage and its single-ended peak amplitude can be programmed using SET\_SYNC\_LEVEL bits in the SET\_SYNC registers (see Table 77 on page 55).

SYNC\_OUT is asynchronous with the frame clock. There is no timing specification with respect to the CLKINP and CLKINN inputs.

### 10.2.3 Comma detection and word align

This stage monitors the data stream for code characters (comma detection), decodes the words to bytes (octets) and performs optional character replacement as part of frame/lane alignment monitoring and correction. This module provides the required control signals to the RX controller and ILA.

This module decodes the 10-bit words into 8-bit words (octets). The decoding table is specified in the IEEE 802.3-2005 specification. During decoding, the disparity is calculated according to the disparity rules mentioned in the same specification IEEE 802.3-2005. When the disparity counter is more than +2 or less than -2, an error will be generated.

The following comma symbols are detected during data transmission irrespective of the running disparity:

/K/ = K28.5

/F/ = K28.7

/A/ = K28.3

/R/ = K28.0

/Q/ = K28.4

A flag is sent to the control interface to reflect detected commas in registers.

The following flags are also triggered according to the following definitions:

- VALID: a code group that is found in the column of the 10b/8b decoding tables according to the current running disparity.
- DISPARITY ERROR: The received code group exists in the 10b/8b decoding table, but is not found in the proper column according to the current running disparity.
- NOT-IN-TABLE (NIT) ERROR: The received code group is not found in the 10b/8b decoding table for either disparity.
- INVALID: a code group that either shows a disparity error or that does not exist in the 10b/8b decoding table.

DAC1208D650 supports character replacement whatever the state of the descrambler. When scrambling is not active, the received K28.3 /A/ or K28.7 /F/ will be replaced by the previous sample. When scrambling is active, the corresponding data octet D28.3 (0xC) or D28.7 (0xFC) will be used.

### 10.2.4 Descrambler

The descrambler is the a 16-bit parallel self-synchronous descrambler based on the polynomial  $1 + x^{14} + x^{15}$ . This processing can be turned off.

### 10.2.5 inter-lane alignment

This feature removes strict PCB design skew compensation between the lanes.

#### 10.2.5.1 Single device operation

This module handles the alignment of the four data streams. Because of inter-lane skew and each PLL per lane concept, these alignment characters may be received at different times by the receivers. After the synchronization period, the lock signal will be HIGH. This enables the receipt of K28.3 /A/ characters. The /A/ characters provided in the initial alignment sequence are used to align the four data streams.

The ILA\_CNTRL register's SEL\_ILA[1:0] bits select which K28.3 /A/ symbol triggers the initial lane alignment: "00" = 1st /A/ symbol, "01" = 2nd /A/ symbol, "10" = 3rd /A/ symbol, "11" = 4th /A/ symbol; Table 86 on page 61. When all receivers have received their first selected /A/, they start propagating the received data to the frame assembly module at the same point in time.

This module can compensate for up to  $\pm 7$  frame clock period misalignments between the lanes.

When initial lane alignment is not supported, the manual alignment mode can be used.

After the initial ILA sequence, the lane alignment monitoring starts. If the received user data contains a K28.3 /A/ symbol:

- its position is compared to the value of the alignment monitor counter
- if two successive K28.3 /A/ symbols have been received at a wrong position, a realignment takes place
- if the buffers are empty or overflow, this is indicated by the registers ILA\_BUF\_ERR\_LN0 to ILA\_BUF\_ERR\_LN3

#### 10.2.5.2 Multi-device operation

DAC1208D650 implements a multi-device inter-lane alignment that guarantees a skew of less than one output period between them.

Two modes are available: master/slave and all slave. Both make use of the MDS\_P and MDS\_N pins.

**Fig 7. Multi-Device Synchronization (MDS) implementation**

Each DAC device of the system generates its own reference (**ref\_A** in Figure 7).

If configured as a slave, an early-late comparator compares the internal reference with the external reference provided by the MDS pins. The comparator controls an internal buffer that is used to delay the samples.

### 10.2.5.3 Master/slave mode

The external reference is provided by one of the DACs (the master DAC), which has to be configured to do this. The others are set to slave mode.

The MDS signal generated by the master DAC must reach all slaves within one DAC output clock period. This induces PCB layout constraints for the MDS signal and also for the clock distribution. Because trace lengths differ, the clock edges will reach each of the DACs at different times.

**Fig 9. Clock skew case 1: Master is the farthest**

The worst case clock skew is given by  $\delta t_1 = PH01 - PH03$ , where  $PH0x$  represents the sum of the trace delay and the clock skew at the output of the clock generator.

The maximum allowable trace delay for the MDS signal is given by  $\Delta t = TDAC - \delta t_1$ .

**Fig 10. Clock skew case 2: Master is closest**

The worst case clock skew is given by  $\delta t_2 = PH03 - PH01$ .

The minimum allowable trace delay for the MDS signal is given by  $\Delta t = \delta t_2$ .

In real applications, the master DAC can be anywhere and both conditions must be satisfied:  $\delta t_2 < \Delta t_{\text{mds}} < TDAC - \delta t_1$ .

Example:

- clock generator skew =  $\pm 80$  ps
- FR4 substrate  $\Rightarrow 15$  cm/ns delay
- clock trace length difference = 3 cm and 4 cm
- Output sampling rate = 650 Msps

$$\Rightarrow 200 \text{ ps} + 80 \text{ ps} < \Delta t_{\text{mds}} < 1538 \text{ ps} - (266 \text{ ps} + 80 \text{ ps})$$

$$\Rightarrow 280 \text{ ps} < \Delta t_{\text{mds}} < 1192 \text{ ps}$$

$$\Rightarrow 4.2 \text{ cm} < L_{\text{mds}} < 17.8 \text{ cm}$$

#### 10.2.5.4 All slave mode

The external reference is provided by the JESD204A transmitter. All DACs are configured in slave mode.

**Fig 11. All slave mode**

The MDS signal is now driven from the transmitter. It is generated at the end of the inter-lane alignment phase (see the JESD204A standard for details).

The transmitter must also compensate for the DAC latency. Although the DAC has an internal samples delay line, it cannot handle large delays.

In this mode, PCB layout is also important. The following delay equation applies:  
 $\delta t < \Delta t_{\text{mds}} < \text{TDAC} - \delta t$ , where  $\delta t$  is the clock skew considered close to DAC pins.

### 10.2.6 Frame assembly

DAC1208D650 supports only  $/F/ = 1$ , which means that every frame clock period carries one byte per lane. Frame assembly combines the octet of lane\_0 with the four MSB bits of lane\_1 and reassembles the original 12-bit sample. The same is done for lane\_2 and lane\_3. Tail bits are dropped.

The frame assembler also handles previously triggered errors.

If scrambling is enabled:

If a nit\_err (not-in-table error) or kout\_unexp (unexpected control character) occurs in lane\_0 and/or lane\_1, the previous 12-bit sample is repeated twice for I (lane\_0, lane\_1). The same is done for Q (lane\_2, lane\_3).

If scrambling is disabled:

If a nit\_err (not-in-table error) or kout\_unexp (unexpected control character) occurs in lane\_0 and/or lane\_1, the previous 12-bit sample will be repeated once for I (lane\_0, lane\_1). The same is done for Q (lane\_2, lane\_3).

Fig 12. Frame assembly

10.3 Serial Peripheral Interface (SPI)

10.3.1 Protocol description

The DAC1208D650 serial interface is a synchronous serial communication port allowing easy interfacing with many industry microprocessors. It provides access to the registers that define the operating modes of the chip in both Write mode and Read mode.

This interface can be configured as a 3-wire type (SDIO as bidirectional pin) or a 4-wire type (SDIO and SDO as unidirectional pin, input and output port respectively). In both configurations, SCLK acts as the serial clock and SCS\_N acts as the serial chip select bar.

Each read/write operation is sequenced by the SCS\_N signal and enabled by a LOW assertion to drive the chip with two bytes to five bytes, depending on the content of the instruction byte (see Table 8).

Table 7. Read or Write mode access description

| R/W | Description          |
|-----|----------------------|
| 0   | Write mode operation |
| 1   | Read mode operation  |

In Table 8 below, N1 and N0 indicate the number of bytes transferred after the instruction byte.

Table 8. Number of bytes to be transferred

| N1 | N0 | Number of bytes transferred |
|----|----|-----------------------------|
| 0  | 0  | 1                           |
| 0  | 1  | 2                           |
| 1  | 0  | 3                           |
| 1  | 1  | 4                           |

A[4:0] indicates which register is being addressed. In the case of a multiple transfer, this address points to the first register to be accessed. The address is then internally decreased after each following data phase.

### 10.3.2 SPI timing description

The SPI interface can operate at a frequency of up to 15 MHz. The SPI timing is shown in Figure 14.

**Fig 14. SPI timing diagram**

The SPI timing characteristics are given in Table 9.

**Table 9. SPI timing characteristics**

| Symbol                  | Parameter           | Min | Typ | Max | Unit |
|-------------------------|---------------------|-----|-----|-----|------|
| $f_{\text{SCLK}}$       | SCLK frequency      | -   | -   | 15  | MHz  |
| $t_w(\text{SCLK})$      | SCLK pulse width    | 30  | -   | -   | ns   |
| $t_{su}(\text{SCS\_N})$ | SCS_N set-up time   | 20  | -   | -   | ns   |
| $t_h(\text{SCS\_N})$    | SCS_N hold time     | 20  | -   | -   | ns   |
| $t_{su}(\text{SDIO})$   | SDIO set-up time    | 10  | -   | -   | ns   |
| $t_h(\text{SDIO})$      | SDIO hold time      | 5   | -   | -   | ns   |
| $t_w(\text{RESET\_N})$  | RESET_N pulse width | 30  | -   | -   | ns   |

## 10.4 Clock input

The DAC1208D650 has one differential clock input, CLKINN/CLKINP.

Fig 15. LVDS clock configuration

Fig 16. Interfacing CML to LVDS

The DAC1208D650 can operate with a clock frequency up to 312.5 MHz or up to 650 MHz if the internal PLL is bypassed. The clock input can be LVDS (see Figure 15) but it can also be interfaced with CML (see Figure 16). Error free data transition from one internal clock domain to another one is handled by Clock Domain Interface (CDI) logic.

During the reset phase (RESET\_N asserted), the clock must be stable and running. This ensures a proper reset of the complete device.

The device has no embedded power-on-reset feature. Driving the RESET\_N pin to set the device to its default state is mandatory.

## 10.5 FIR filters

The three interpolation FIR filters have a stop band attenuation of at least 80 dBc and a pass band ripple of less than 0,0005 dB.

**Table 10. Interpolation filter coefficients**

| First interpolation filter |       |       | Second interpolation filter |       |       | Third interpolation filter |       |       |
|----------------------------|-------|-------|-----------------------------|-------|-------|----------------------------|-------|-------|
| Lower                      | Upper | Value | Lower                       | Upper | Value | Lower                      | Upper | Value |
| H(1)                       | H(55) | −4    | H(1)                        | H(23) | −2    | H(1)                       | H(15) | −39   |
| H(2)                       | H(54) | 0     | H(2)                        | H(22) | 0     | H(2)                       | H(14) | 0     |
| H(3)                       | H(53) | 13    | H(3)                        | H(21) | 17    | H(3)                       | H(13) | 273   |
| H(4)                       | H(52) | 0     | H(4)                        | H(20) | 0     | H(4)                       | H(12) | 0     |
| H(5)                       | H(51) | −34   | H(5)                        | H(19) | −75   | H(5)                       | H(11) | −1102 |
| H(6)                       | H(50) | 0     | H(6)                        | H(18) | 0     | H(6)                       | H(10) | 0     |
| H(7)                       | H(49) | 72    | H(7)                        | H(17) | 238   | H(7)                       | H(9)  | 4964  |
| H(8)                       | H(48) | 0     | H(8)                        | H(16) | 0     | H(8)                       | -     | 8192  |
| H(9)                       | H(47) | −138  | H(9)                        | H(15) | −660  | -                          | -     | -     |
| H(10)                      | H(46) | 0     | H(10)                       | H(14) | 0     | -                          | -     | -     |
| H(11)                      | H(45) | 245   | H(11)                       | H(13) | 2530  | -                          | -     | -     |
| H(12)                      | H(44) | 0     | H(12)                       | -     | 4096  | -                          | -     | -     |

## 10.6 Quadrature modulator and Numerically Controlled Oscillator (NCO)

The quadrature modulator allows the 12-bit I and Q data to be mixed with the carrier signal generated by the NCO.

The frequency of the NCO is programmed over 32 bits and the sign of the sine component can be inverted in order to operate positive or negative, lower or upper single sideband up-conversion.

### 10.6.1 NCO in 32-bit

When using the NCO, the frequency can be set by the four registers `FREQNCO_LSB`, `FREQNCO_LISB`, `FREQNCO_UISB` and `FREQNCO_MSB` over 32 bits.

The frequency for the NCO in 32-bit is calculated as follows:

$$f_{NCO} = \frac{M \times f_s}{2^{32}} \quad (1)$$

where M is the decimal representation of `FREQ_NCO[31:0]`.

The phase of the NCO can be set from 0° to 360° by both registers `PHINCO_LSB` and `PHINCO_MSB` over 16 bits.

The default setting is  $f_{NCO} = 96 \text{ MHz}$  when  $f_s = 640 \text{ Msps}$  and the default phase is 0°.

### 10.6.2 Low-power NCO

When using the low-power NCO, the frequency can be set by the five MSBs of register `FREQNCO_MSB`.

The frequency for the low-power NCO is calculated as follows:

$$f_{NCO} = \frac{M \times f_s}{2^5} \quad (2)$$

where M is the decimal representation of `FREQ_NCO[31:27]`.

The phase of the low-power NCO can be set by the five MSBs of the register `PHINCO_MSB`.

### 10.6.3 Minus\_3dB

During normal use, a full-scale pattern will also be full-scale at the output of the DAC. Nevertheless, when the I and Q data are simultaneously close to full-scale, some clipping can occur and the `minus_3dB` function can be used to reduce the gain in the modulator by 3 dB. This is to keep a full-scale range at the output of the DAC without added interferers.

## 10.7 x / (sin x)

The roll-off effect of the DAC causes a selectable FIR filter to be inserted to compensate for the  $(\sin x) / x$  effect. This filter introduces a DC loss of 3.4 dB. The coefficients are represented in Table 11.

Table 11. Inversion filter coefficients

| First interpolation filter |       |       |
|----------------------------|-------|-------|
| Lower                      | Upper | Value |
| H(1)                       | H(9)  | 2     |
| H(2)                       | H(8)  | −4    |
| H(3)                       | H(7)  | 10    |
| H(4)                       | H(6)  | −35   |
| H(5)                       | -     | 401   |

## 10.8 DAC transfer function

The full-scale output current for each DAC is the sum of the two complementary current outputs:

$$I_{O(fs)} = I_{IOUTP} + I_{IOUTN} \quad (3)$$

The output current depends on the digital input data:

$$I_{IOUTP} = I_{O(fs)} \times \left( \frac{DATA}{4095} \right) \quad (4)$$

$$I_{IOUTN} = I_{O(fs)} \times \left( \frac{4095 - DATA}{4095} \right) \quad (5)$$

The setting applied to register COMMON bit DF (register 00h[2]; see Table 17 “Page 0 register allocation map”) defines whether the DAC1208D650 operates with a binary input or a two’s complement input.

Table 12 shows the output current as a function of the input data, when  $I_{O(fs)} = 20$  mA.

Table 12. DAC transfer function

| Data | I13/Q13 to I0/Q0 |                  | IOUTnP | IOUTnN |
|------|------------------|------------------|--------|--------|
|      | Binary           | Two’s complement |        |        |
| 0    | 0000 0000 0000   | 1000 0000 0000   | 0 mA   | 20 mA  |
| ...  | ...              | ...              | ...    | ...    |
| 2048 | 1000 0000 0000   | 0000 0000 0000   | 10 mA  | 10 mA  |
| ...  | ...              | ...              | ...    | ...    |
| 4095 | 1111 1111 1111   | 0111 1111 1111   | 20 mA  | 0 mA   |

## 10.9 Full-scale current

### 10.9.1 Regulation

The DAC1208D650 reference circuitry integrates an internal band gap reference voltage which delivers a 1.29 V reference to the GAPOUT pin. It is recommended to decouple pin GAPOUT using a 100 nF capacitor.

The reference current is generated via an external resistor of 953  $\Omega$  (1 %) connected to pin VIRES. A control amplifier sets the appropriate full-scale current ( $I_{O(fs)}$ ) for both DACs (see Figure 17).

Fig 17. Internal reference configuration

This configuration is optimum for temperature drift compensation because the band gap reference voltage can be matched to the voltage across the feedback resistor.

#### 10.9.1.1 External regulation

The DAC current can also be set by applying an external reference voltage to the non-inverting input pin GAPOUT and disabling the internal band gap reference voltage with bit GAP\_PD (register 00h[0]; see Table 18 “COMMON register (address 00h) bit description”).

### 10.9.2 Full-scale current adjustment

The default full-scale current ( $I_{O(fs)}$ ) is 20 mA but further adjustments can be made by the user to both DACs independently using the serial interface from 1.6 mA to 22 mA,  $\pm 10\%$ .

The settings applied to DAC\_A\_GAIN\_COARSE[3:0] (register 0Ah; see Table 28 “DAC\_A\_CFG\_2 register (address 0Ah) bit description” and register 0Bh; see Table 29 “DAC\_A\_CFG\_3 register (address 0Bh) bit description”) and DAC\_B\_GAIN\_COARSE[3:0] (register 0Dh; see Table 31 “DAC\_B\_CFG\_2 register (address 0Dh) bit description” and register 0Eh; see Table 32 “DAC\_B\_CFG\_3 register (address 0Eh) bit description”) define the coarse variation of the full-scale current (see Table 13).

**Table 13.**  $I_{O(fs)}$  coarse adjustment

Default settings are shown highlighted.

| DAC_GAIN_COARSE[3:0] |             | $I_{O(fs)}$ (mA) |
|----------------------|-------------|------------------|
| Decimal              | Binary      |                  |
| 0                    | 0000        | 1.6              |
| 1                    | 0001        | 3.0              |
| 2                    | 0010        | 4.4              |
| 3                    | 0011        | 5.8              |
| 4                    | 0100        | 7.2              |
| 5                    | 0101        | 8.6              |
| 6                    | 0110        | 10.0             |
| 7                    | 0111        | 11.4             |
| 8                    | 1000        | 12.8             |
| 9                    | 1001        | 14.2             |
| 10                   | 1010        | 15.6             |
| 11                   | 1011        | 17.0             |
| 12                   | 1100        | 18.5             |
| <b>13</b>            | <b>1101</b> | <b>20.0</b>      |
| 14                   | 1110        | 21.0             |
| 15                   | 1111        | 22.0             |

The settings applied to DAC\_A\_GAIN\_FINE[5:0] (register 0Ah; see Table 28 “DAC\_A\_CFG\_2 register (address 0Ah) bit description”) and to DAC\_B\_GAIN\_FINE[5:0] (register 0Dh; see Table 31 “DAC\_B\_CFG\_2 register (address 0Dh) bit description”) define the fine variation of the full-scale current (see Table 14).

**Table 14.**  $I_{O(fs)}$  fine adjustment

Default settings are shown highlighted.

| DAC_GAIN_FINE[5:0] |                  | Delta $I_{O(fs)}$ |
|--------------------|------------------|-------------------|
| Decimal            | Two's complement |                   |
| –32                | 10 0000          | –10 %             |
| ...                | ...              | ...               |
| <b>0</b>           | <b>00 0000</b>   | <b>0</b>          |
| ...                | ...              | ...               |
| 31                 | 01 1111          | +10 %             |

The coding of the fine gain adjustment is two's complement.

## 10.10 Digital offset correction

When the DAC1208D650 analog output is DC connected to the next stage, the digital offset correction can be used to adjust the common-mode level at the output of the DAC. It adds an offset at the end of the digital part, just before the DAC.

The settings applied to DAC\_A\_OFFSET[11:0] (register 09h; see Table 27 “DAC\_A\_CFG\_1 register (address 09h) bit description”) and register 0Bh; see Table 29 “DAC\_A\_CFG\_3 register (address 0Bh) bit description”) and to “DAC\_B\_OFFSET[11:0]”

(register 0Ch; see Table 30 “DAC\_B\_CFG\_1 register (address 0Ch) bit description” and register 0Eh; see Table 32 “DAC\_B\_CFG\_3 register (address 0Eh) bit description”) define the range of variation of the digital offset (see Table 15).

**Table 15. Digital offset adjustment**

Default settings are shown highlighted.

| DAC_OFFSET[11:0] |                       | Offset applied |
|------------------|-----------------------|----------------|
| Decimal          | Two's complement      |                |

| <b>0</b>         | <b>0000 0000 0000</b> | <b>0</b>       |
| +1               | 0000 0000 0001        | +2             |
| ...              | ...                   | ...            |
| 2046             | 0111 1111 1110        | +4092          |
| 2047             | 0111 1111 1111        | +4094          |

## 10.11 Analog output

The DAC1208D650 has two output channels each of which produces two complementary current outputs. These allow the even-order harmonics and noise to be reduced. The pins are IOUTAP/IOUTAN and IOUTBP/IOUTBN respectively and need to be connected via a load resistor  $R_L$  to the 3.3 V analog power supply ( $V_{DDA(3V3)}$ ).

The equivalent analog output circuit of one DAC is shown in Figure 18. This circuit consists of a parallel combination of NMOS current sources and their associated switches for each segment.

**Fig 18. Equivalent analog output circuit (one DAC)**

The cascode source configuration increases the output impedance of the source, thus improving the dynamic performance of the DAC by introducing less distortion.

The device can provide an output level ( $V_{o(p-p)}$ ) of up to 2 V, depending on the application, the following stages and the targeted performances.

10.12 Auxiliary DACs

The DAC1208D650 integrates two auxiliary DACs that can be used to compensate for any offset between the DAC and the next stage in the transmission path.

Both auxiliary DACs have a 10-bit resolution and are current sources (referenced to ground).

$$I_{O(AUX)} = I_{AUXP} + I_{AUXN}$$
 (6)

The output current depends on the auxiliary DAC data:

$$AUXP = I_{O(AUX)} \times \left( \frac{AUX[9:0]}{1023} \right)$$
 (7)

$$AUXN = I_{O(AUX)} \times \left( \frac{(1023 - AUX[9:0])}{1023} \right)$$
 (8)

Table 16 shows the output current as a function of the auxiliary DAC data.

**Table 16. Auxiliary DAC transfer function**  
*Default settings are shown highlighted.*

| Data       | AUX[9:0] (binary)   | I <sub>AUXP</sub> | I <sub>AUXN</sub> |
|------------|---------------------|-------------------|-------------------|
| 0          | 00 0000 0000        | 0 mA              | 2.2 mA            |
| ...        | ...                 | ...               | ...               |
| <b>512</b> | <b>10 0000 0000</b> | <b>1.1 mA</b>     | <b>1.1 mA</b>     |
| ...        | ...                 | ...               | ...               |
| 1023       | 11 1111 1111        | 2.2 mA            | 0 mA              |

## 10.13 Output configuration

### 10.13.1 Basic output configuration

The use of a differentially-coupled transformer output provides optimum distortion performance (see Figure 19). In addition, it helps to match the impedance and provides electrical isolation.

**Fig 19. 1  $V_{o(p-p)}$  differential output with transformer**

The DAC1208D650 can operate at a  $V_{o(p-p)}$  of 2 V differential outputs. In this configuration, it is recommended to connect the center tap of the transformer to a 62 Ω resistor connected to the 3.3 V analog power supply in order to adjust the DC common-mode to approximately 2.7 V (see Figure 20).

**Fig 20. 2  $V_{o(p-p)}$  differential output with transformer**

### 10.13.2 DC interface to an Analog Quadrature Modulator (AQM)

When the system operation requires to keep the DC component of the spectrum, the DAC1208D650 must use a DC interface to connect to an AQM. In this case, the offset compensation for LO cancellation can be made with the use of the digital offset control in the DAC.

Figure 21 is an example of a connection to an AQM with a common-mode input level ( $V_{i(cm)}$ ) of 1.7 V.

**Fig 21. Example of a DC interface connection to an AQM with a  $V_{i(cm)}$  of 1.7 V**

Figure 22 is an example of a connection to an AQM with a common-mode input level ( $V_{i(cm)}$ ) of 3.3 V.

**Fig 22. Example of a DC interface connection to an AQM with a  $V_{i(cm)}$  of 3.3 V**

The auxiliary DACs can be used to control the offset in a precise range or with precise steps.

Figure 23 is an example of a DC interface connected to an AQM with a common-mode input level ( $V_{i(cm)}$ ) of 1.7 V when using auxiliary DACs.

Figure 24 is an example of a DC interface connected to an AQM with a common-mode input level ( $V_{i(cm)}$ ) of 3.3 V when using auxiliary DACs.

The constraints to adjusting the interface are the output compliance range of the DAC and the auxiliary DACs, the input common-mode level of the AQM, and the range of offset correction.

### 10.13.3 AC interface to an Analog Quadrature Modulator (AQM)

When the AQM common-mode voltage is close to ground, the DAC1208D650 must be AC-coupled and the auxiliary DACs are needed for offset correction.

Figure 25 is an example of a connection to an AQM with a common-mode input level ( $V_{i(cm)}$ ) of 0.5 V when using auxiliary DACs.

#### 10.13.4 Phase correction

The Analog Quadrature Modulator which follows the DACs may have a phase imbalance which will result in undesired sidebands. By adjusting the phase between the I and Q channels, the spur can be reduced.

Without compensation the I and Q have a phase difference of  $\pi / 2$  ( $90^\circ$ ). The registers PHASECORR\_CNTRL0 and PHASECORR\_CNTRL1 located in register page 0 allow a phase variation from  $75.7^\circ$  to  $104.3^\circ$ . The two registers define a signed value that ranges from  $-512$  to  $+511$ . The resulting phase compensation (in radians) is given by the equation:  $\text{PHASE\_CORR}[9:0] / 2048$ .

#### 10.14 Power and grounding

The power supplies should be decoupled with the following ground pins to optimize the decoupling:

- $V_{DDA(1V8)}$ : pin 38 with pin 37; pin 44 with pin 43; pin 11 with pin 12; pin 17 with pin 18; pin 32 with pin 31.

#### 10.15 Configuration interface

##### 10.15.1 Register description

DAC1208D650 implements indirect addressing using a page access method. The page-address is located at address 0x1F and is by default 0x00, which selects page 0 as the default page. For example, to access registers which configure the JESDRX, one must first activate page 4 by writing 0x04 to the page-address 0x1F.

The DAC1208D650 contains six different pages.

The device has no embedded power-on-reset feature. Driving the RESET\_N pin to set the device to its default state is mandatory.

##### 10.15.2 Detailed descriptions of registers

The register information has been provided in page form accompanied by a detailed description for each bit in the tables following the register allocation map of each page.

## 10.15.2.1 Page 0 allocation map description

Table 17. Page 0 register allocation map

| Address |     | Register name    | R/W | Bit definition         |             |                   |                      |                   |                |                  |              | Default  |          |     |
|---------|-----|------------------|-----|------------------------|-------------|-------------------|----------------------|-------------------|----------------|------------------|--------------|----------|----------|-----|
|         |     |                  |     | b7                     | b6          | b5                | b4                   | b3                | b2             | b1               | b0           | Bin      | Hex      |     |

## 10.15.2.2 Page 0 bit definition detailed description

Please refer to Table 17 for a register overview for page 0. In the following tables, all the values emphasized in bold are the default values.

Table 18. COMMON register (address 00h) bit description

Default settings are shown highlighted.

| Bit | Symbol  | Access | Value    | Description                                        |
|-----|---------|--------|----------|----------------------------------------------------|
| 7   | SPI_3W  | R/W    |          | serial interface bus type                          |
|     |         |        | 0        | 4 wire SPI                                         |
|     |         |        | <b>1</b> | <b>3 wire SPI</b>                                  |
| 6   | SPI_RST | R/W    |          | serial interface reset                             |
|     |         |        | <b>0</b> | <b>no reset</b>                                    |
|     |         |        | 1        | performs a reset on all registers except 0x00      |
| 2   | DF      | R/W    |          | data format                                        |
|     |         |        | 0        | signed (two's compliment) format                   |
|     |         |        | <b>1</b> | <b>unsigned format</b>                             |
| 1   | PD_ALL  | R/W    |          | power-down                                         |
|     |         |        | <b>0</b> | <b>no action</b>                                   |
|     |         |        | 1        | all circuits (digital and analog) are switched off |
| 0   | GAP_PD  | R/W    |          | internal band gap power-down                       |
|     |         |        | <b>0</b> | <b>no action</b>                                   |
|     |         |        | 1        | internal band gap references are switched off      |

Table 19. TXCFG register (address 01h) bit description

Default settings are shown highlighted.

| Bit    | Symbol      | Access | Value      | Description                                                                              |
|--------|-------------|--------|------------|------------------------------------------------------------------------------------------|
| 7      | NCO_EN      | R/W    |            | NCO                                                                                      |
|        |             |        | <b>0</b>   | <b>disabled (the NCO phase is reset to 0)</b>                                            |
|        |             |        | 1          | enabled                                                                                  |
| 6      | NCO_LP_SEL  | R/W    |            | low-power NCO                                                                            |
|        |             |        | <b>0</b>   | <b>NCO may use all 32 bits</b>                                                           |
|        |             |        | 1          | NCO frequency and phase given by the five MSBs of the registers 06h and 08h respectively |
| 5      | INV_SINE_EN | R/W    |            | $x / (\sin x)$ function                                                                  |
|        |             |        | <b>0</b>   | <b>disabled</b>                                                                          |
|        |             |        | 1          | enabled                                                                                  |
| 4 to 2 | MODE[2:0]   | R/W    |            | modulation                                                                               |
|        |             |        | <b>000</b> | <b>dual DAC: no modulation</b>                                                           |
|        |             |        | 001        | positive upper single sideband up-conversion                                             |
|        |             |        | 010        | positive lower single sideband up-conversion                                             |
|        |             |        | 011        | negative upper single sideband up-conversion                                             |
|        |             |        | 100        | negative lower single sideband up-conversion                                             |
|        |             |        |            |                                                                                          |

**Table 19. TXCFG register (address 01h) bit description ...continued**

Default settings are shown highlighted.

| Bit    | Symbol       | Access | Value     | Description      |
|--------|--------------|--------|-----------|------------------|
| 1 to 0 | INT_FIR[1:0] | R/W    |           | interpolation    |
|        |              |        | 00        | no interpolation |
|        |              |        | <b>01</b> | <b>2×</b>        |
|        |              |        | 10        | 4×               |
|        |              |        | 11        | 8×               |

## 10.15.2.6 Page 2 bit definition detailed description

Please refer to Table 59 for a register overview and their default values. In the following tables, all the values emphasized in bold are the default values.

**Table 60. MAINCONTROL register (address 00h) bit description**

Default settings are shown highlighted.

| Bit | Symbol           | Access | Value    | Description                            |
|-----|------------------|--------|----------|----------------------------------------|
| 5   | FULL_RE_INIT     | R/W    |          | initialization                         |
|     |                  |        | <b>0</b> | <b>quick reinitialization</b>          |
|     |                  |        | 1        | full reinitialization                  |
| 4   | SYNC_INIT_LEVEL  | R/W    |          | synchronization                        |
|     |                  |        | <b>0</b> | <b>synchronization starts with '0'</b> |
|     |                  |        | 1        | synchronization starts with '1'        |
| 3   | -                | R/W    |          | must be written with '0'               |
| 2   | -                | R/W    |          | must be written with '0'               |
| 1   | FORCE_RESET_DCLK | R/W    |          | reset_dclk                             |
|     |                  |        | 0        | release reset_dclk                     |
|     |                  |        | <b>1</b> | <b>force reset_dclk</b>                |
| 0   | FORCE_RESET_FCLK | R/W    |          | reset_fclk                             |
|     |                  |        | 0        | release reset_fclk                     |
|     |                  |        | <b>1</b> | <b>force reset_fclk</b>                |

**Table 61. JCLK\_CNTRL register (address 03h) bit description**

Default settings are shown highlighted.

| Bit    | Symbol        | Access | Value     | Description                        |
|--------|---------------|--------|-----------|------------------------------------|
| 7      | SR_CDI        | R/W    |           | cdi reset                          |
|        |               |        | <b>0</b>  | <b>no action</b>                   |
|        |               |        | 1         | soft reset cdi                     |
| 5 to 4 | CDI_MODE[1:0] | R/W    |           | cdi mode                           |
|        |               |        | <b>00</b> | <b>cdi_mode 0 (^2 modes)</b>       |
|        |               |        | 01        | cdi_mode 1 (^4 modes)              |
|        |               |        | 10        | cdi_mode 2 (^8 modes)              |
|        |               |        | 11        | reserved                           |
| 2      | FCLK_POL      | R/W    |           | f <sub>clk</sub> polarity          |
|        |               |        | <b>0</b>  | <b>no action</b>                   |
|        |               |        | 1         | invert polarity                    |
| 1 to 0 | FCLK_SEL[1:0] | R/W    |           | f <sub>clk</sub> clock source      |
|        |               |        | <b>00</b> | <b>dclk × 2</b>                    |
|        |               |        | 01        | dclk                               |
|        |               |        | 10        | dclk_div2; running                 |
|        |               |        | 11        | dclk_div2; reset dclk_div2 divider |

**Table 62. RST\_EXT\_FCLK register (address 04h) bit description**

Default settings are shown highlighted.

| Bit    | Symbol                 | Access | Value | Description                                              |
|--------|------------------------|--------|-------|----------------------------------------------------------|
| 7 to 0 | RST_EXT_FCLK_TIME[7:0] | R/W    | 3Fh   | specifies extension time reset_fclk in $f_{clk}$ periods |

**Table 63. RST\_EXT\_DCLK register (address 05h) bit description**

Default settings are shown highlighted.

| Bit    | Symbol                 | Access | Value | Description                                           |
|--------|------------------------|--------|-------|-------------------------------------------------------|
| 7 to 0 | RST_EXT_DCLK_TIME[7:0] | R/W    | 20h   | specifies extension time reset_dclk (in dclk-periods) |

**Table 64. DCSMU\_PREDIVCNT register (address 06h) bit description**

Default settings are shown highlighted.

| Bit    | Symbol                | Access | Value | Description                                    |
|--------|-----------------------|--------|-------|------------------------------------------------|
| 7 to 0 | DCSMU_PREDIVIDER[7:0] | R/W    | 1Eh   | value used by dcsmu predivider (at $f_{clk}$ ) |

**Table 65. PLL\_CHARGETIME register (address 07h) bit description**

Default settings are shown highlighted.

| Bit    | Symbol               | Access | Value | Description                                               |
|--------|----------------------|--------|-------|-----------------------------------------------------------|
| 7 to 0 | PLL_CHARGE_TIME[7:0] | R/W    | 32h   | PLL charge time<br>(at $f_{clk}/DCSMU\_PREDIVIDER[7:0]$ ) |

**Table 66. PLL\_RUNIN\_TIME register (address 08h) bit description**

Default settings are shown highlighted.

| Bit    | Symbol              | Access | Value | Description                                            |
|--------|---------------------|--------|-------|--------------------------------------------------------|
| 7 to 0 | PLL_RUNIN_TIME[7:0] | R/W    | 32h   | PLL run in time (at $f_{clk}/DCSMU\_PREDIVIDER[7:0]$ ) |

**Table 67. CA\_RUNIN\_TIME register (address 09h) bit description**

Default settings are shown highlighted.

| Bit    | Symbol             | Access | Value | Description                                                           |
|--------|--------------------|--------|-------|-----------------------------------------------------------------------|
| 7 to 0 | CA_RUNIN_TIME[7:0] | R/W    | 04h   | clock alignment run in time<br>(at $f_{clk}/DCSMU\_PREDIVIDER[7:0]$ ) |

**Table 68. SET\_VCM\_VOLTAGE register (address 16h) bit description**

Default settings are shown highlighted.

| Bit    | Symbol       | Access | Value | Description                                 |
|--------|--------------|--------|-------|---------------------------------------------|
| 3 to 0 | SET_VCM[3:0] | R/W    | 02h   | set lane common-mode voltage (see Table 75) |

**Table 69. SET\_SYNC register (address 17h) bit description**

Default settings are shown highlighted.

| Bit    | Symbol              | Access | Value | Description                                                          |
|--------|---------------------|--------|-------|----------------------------------------------------------------------|
| 6 to 4 | SET_SYNC_VCOM[2:0]  | R/W    | 4h    | set synchronization transmitter common-mode level<br>(see Table 76)  |
| 2 to 0 | SET_SYNC_LEVEL[2:0] | R/W    | 3h    | set synchronization transmitter output level swing<br>(see Table 77) |

**Table 70. TYPE\_ID register (address 1Bh) bit description**

Default settings are shown highlighted.

| Bit    | Symbol         | Access | Value     | Description                                           |
|--------|----------------|--------|-----------|-------------------------------------------------------|
| 7      | DAC            | R      |           | part type                                             |

## 10.15.2.8 Page 4 bit definition detailed description

Please refer to Table 78 for a register overview and their default values. In the following tables, all the values emphasized in bold are the default values.

Table 79. SR\_DLP\_0 register (address 00h) bit description

Default settings are shown highlighted.

| Bit | Symbol     | Access | Value | Description                           |
|-----|------------|--------|-------|---------------------------------------|
| 7   | SR_SWA_LN3 | R/W    | 0     | soft reset sync_word_alignment lane 3 |
| 6   | SR_SWA_LN2 | R/W    | 0     | soft reset sync_word_alignment lane 2 |
| 5   | SR_SWA_LN1 | R/W    | 0     | soft reset sync_word_alignment lane 1 |
| 4   | SR_SWA_LN0 | R/W    | 0     | soft reset sync_word_alignment lane 0 |
| 3   | SR_CA_LN3  | R/W    | 0     | soft reset clock_alignment lane 3     |
| 2   | SR_CA_LN2  | R/W    | 0     | soft reset clock_alignment lane 2     |
| 1   | SR_CA_LN1  | R/W    | 0     | soft reset clock_alignment lane 1     |
| 0   | SR_CA_LN0  | R/W    | 0     | soft reset clock_alignment lane 0     |

Table 80. SR\_DLP\_1 register (address 01h) bit description

Default settings are shown highlighted.

| Bit | Symbol       | Access | Value | Description                     |
|-----|--------------|--------|-------|---------------------------------|
| 7   | SR_CNTRL_LN3 | R/W    | 0     | soft reset controller lane 3    |
| 6   | SR_CNTRL_LN2 | R/W    | 0     | soft reset controller lane 2    |
| 5   | SR_CNTRL_LN1 | R/W    | 0     | soft reset controller lane 1    |
| 4   | SR_CNTRL_LN0 | R/W    | 0     | soft reset controller lane 0    |
| 3   | SR_DEC_LN3   | R/W    | 0     | soft reset decoder_10b8b lane 3 |
| 2   | SR_DEC_LN2   | R/W    | 0     | soft reset decoder_10b8b lane 2 |
| 1   | SR_DEC_LN1   | R/W    | 0     | soft reset decoder_10b8b lane 1 |
| 0   | SR_DEC_LN0   | R/W    | 0     | soft reset decoder_10b8b lane 0 |

Table 81. FORCE\_LOCK register (address 02h) bit description

Default settings are shown highlighted.

| Bit | Symbol         | Access | Value | Description                                      |
|-----|----------------|--------|-------|--------------------------------------------------|
| 7   | FORCE_LOCK_LN3 | R/W    |       | lane 3 lock mode                                 |
|     |                |        | 0     | <b>automatic lock sync_word_alignment lane 3</b> |
|     |                |        | 1     | manual lock sync_word_alignment lane 3           |
| 6   | FORCE_LOCK_LN2 | R/W    |       | lane 2 lock mode                                 |
|     |                |        | 0     | <b>automatic lock sync_word_alignment lane 2</b> |
|     |                |        | 1     | manual lock sync_word_alignment lane 2           |
| 5   | FORCE_LOCK_LN1 | R/W    |       | lane 1 lock mode                                 |
|     |                |        | 0     | <b>automatic lock sync_word_alignment lane 1</b> |
|     |                |        | 1     | manual lock sync_word_alignment lane 1           |
| 4   | FORCE_LOCK_LN0 | R/W    |       | lane 0 lock mode                                 |
|     |                |        | 0     | <b>automatic lock sync_word_alignment lane 0</b> |
|     |                |        | 1     | manual lock sync_word_alignment lane 0           |

**Table 81. FORCE\_LOCK register (address 02h) bit description ...continued**

Default settings are shown highlighted.

| Bit | Symbol | Access | Value | Description                     |
|-----|--------|--------|-------|---------------------------------|
| 0   | SR_ILA | R/W    |       | soft reset inter-lane alignment |
|     |        |        | 0     | no action                       |
|     |        |        | 1     | reset                           |

**Table 82. MAN\_LOCK\_LN\_1\_0 register (address 03h) bit description**

Default settings are shown highlighted.

| Bit    | Symbol            | Access | Value | Description                                               |
|--------|-------------------|--------|-------|-----------------------------------------------------------|
| 7 to 4 | MAN_LOCK_LN1[3:0] | R/W    | 0h    | manual lock setting synchronization word alignment lane 1 |

[1] u = undefined at power-up or after reset.

**10.15.2.10 Page 5 bit definition detailed description**

Please refer to Table 108 for a register overview and their default values. In the following tables, all the values emphasized in bold are the default values.

**Table 109. ILA\_MON\_1\_0 register (address 00h) bit description**

Default settings are shown highlighted.

| Bit    | Symbol           | Access | Value | Description         |
|--------|------------------|--------|-------|---------------------|
| 7 to 4 | ILA_MON_LN1[3:0] | R      | -     | ila_buf_In1 pointer |
| 3 to 0 | ILA_MON_LN0[3:0] | R      | -     | ila_buf_In0 pointer |

**Table 110. ILA\_MON\_3\_2 register (address 01h) bit description**

Default settings are shown highlighted.

| Bit    | Symbol           | Access | Value | Description         |
|--------|------------------|--------|-------|---------------------|
| 7 to 4 | ILA_MON_LN3[3:0] | R      | -     | ila_buf_In3 pointer |
| 3 to 0 | ILA_MON_LN2[3:0] | R      | -     | ila_buf_In2 pointer |

**Table 111. ILA\_BUF\_ERR register (address 02h) bit description**

Default settings are shown highlighted.

| Bit | Symbol          | Access | Value | Description                         |
|-----|-----------------|--------|-------|-------------------------------------|
| 3   | ILA_BUF_ERR_LN3 | R      |       | lane 3 ila buffer error             |
|     |                 |        | 0     | ila_buf_In3 pointer is in range     |
|     |                 |        | 1     | ila_buf_In3 pointer is out of range |
| 2   | ILA_BUF_ERR_LN2 | R      |       | lane 2 ila buffer error             |
|     |                 |        | 0     | ila_buf_In2 pointer is in range     |
|     |                 |        | 1     | ila_buf_In2 pointer is out of range |
| 1   | ILA_BUF_ERR_LN1 | R      |       | lane 1 ila buffer error             |
|     |                 |        | 0     | ila_buf_In1 pointer is in range     |
|     |                 |        | 1     | ila_buf_In1 pointer is out of range |
| 0   | ILA_BUF_ERR_LN0 | R      |       | lane 0 ila buffer error             |
|     |                 |        | 0     | ila_buf_In0 pointer is in range     |
|     |                 |        | 1     | ila_buf_In0 pointer is out of range |

**Table 112. CA\_MON register (address 03h) bit description**

Default settings are shown highlighted.

| Bit    | Symbol          | Access | Value | Description                          |
|--------|-----------------|--------|-------|--------------------------------------|
| 7 to 6 | CA_MON_LN3[1:0] | R      | -     | clock alignment phase monitor lane 3 |
| 5 to 4 | CA_MON_LN2[1:0] | R      | -     | clock alignment phase monitor lane 2 |
| 3 to 2 | CA_MON_LN1[1:0] | R      | -     | clock alignment phase monitor lane 1 |
| 1 to 0 | CA_MON_LN0[1:0] | R      | -     | clock alignment phase monitor lane 0 |

Table 113. DEC\_FLAGS register (address 04h) bit description

| Bit | Symbol           | Access | Value | Description                    |
|-----|------------------|--------|-------|--------------------------------|
| 7   | DEC_NIT_ERR_LN3  | R      | -     | not-in-table error flag lane 3 |

**10.15.2.12 Page 6 bit definition detailed description**

Please refer to Table 143 for a register overview and their default values. In the following tables, all the values emphasized in bold are the default values.

**Table 144. LN0\_CFG\_0 register (address 00h) bit description**

Default settings are shown highlighted.

| Bit    | Symbol       | Access | Value | Description      |
|--------|--------------|--------|-------|------------------|
| 7 to 0 | LN0_DID[7:0] | R      | -     | lane 0 device ID |

**Table 145. LN0\_CFG\_1 register (address 01h) bit description**

Default settings are shown highlighted.

| Bit    | Symbol       | Access | Value | Description    |
|--------|--------------|--------|-------|----------------|
| 3 to 0 | LN0_BID[3:0] | R      | -     | lane 0 bank ID |

**Table 146. LN0\_CFG\_2 register (address 02h) bit description**

Default settings are shown highlighted.

| Bit    | Symbol       | Access | Value | Description    |
|--------|--------------|--------|-------|----------------|
| 4 to 0 | LN0_LID[4:0] | R      | -     | lane 0 lane ID |

**Table 147. LN0\_CFG\_3 register (address 03h) bit description**

Default settings are shown highlighted.

| Bit    | Symbol     | Access | Value | Description             |
|--------|------------|--------|-------|-------------------------|
| 7      | LN0_SCR    | R      | -     | scrambling on           |
| 4 to 0 | LN0_L[4:0] | R      | -     | number of lanes minus 1 |

**Table 148. LN0\_CFG\_4 register (address 04h) bit description**

Default settings are shown highlighted.

| Bit    | Symbol     | Access | Value | Description                        |
|--------|------------|--------|-------|------------------------------------|
| 7 to 0 | LN0_F[7:0] | R      | -     | number of octets per frame minus 1 |

**Table 149. LN0\_CFG\_5 register (address 05h) bit description**

Default settings are shown highlighted.

| Bit    | Symbol     | Access | Value | Description                              |
|--------|------------|--------|-------|------------------------------------------|
| 4 to 0 | LN0_K[4:0] | R      | -     | number of frames per multi-frame minus 1 |

**Table 150. LN0\_CFG\_6 register (address 06h) bit description**

Default settings are shown highlighted.

| Bit    | Symbol     | Access | Value | Description                             |
|--------|------------|--------|-------|-----------------------------------------|
| 7 to 0 | LN0_M[7:0] | R      | -     | number of converters per device minus 1 |

**Table 151. LN0\_CFG\_7 register (address 07h) bit description**

Default settings are shown highlighted.

| Bit    | Symbol      | Access | Value | Description                  |
|--------|-------------|--------|-------|------------------------------|
| 7 to 6 | LN0_CS[1:0] | R      | -     | number of control bits       |
| 4 to 0 | LN0_N[4:0]  | R      | -     | converter resolution minus 1 |

**Table 152. LN0\_CFG\_8 register (address 08h) bit description**

Default settings are shown highlighted.

| Bit    | Symbol      | Access | Value | Description                       |
|--------|-------------|--------|-------|-----------------------------------|
| 4 to 0 | LN0_N'[4:0] | R      | -     | number of bits per sample minus 1 |

**Table 153. LN0\_CFG\_9 register (address 09h) bit description**

Default settings are shown highlighted.

| Bit    | Symbol     | Access | Value | Description                                             |

## 12. Abbreviations

Table 203. Abbreviations

| Acronym  | Description                                             |
|----------|---------------------------------------------------------|
| AQM      | Analog Quadrature Modulator                             |
| BER      | Bit Error Rate                                          |
| BW       | BandWidth                                               |
| CDI      | Clock Domain Interface                                  |
| CDMA     | Code Division Multiple Access                           |
| CML      | Current Mode Logic                                      |
| CMOS     | Complementary Metal Oxide Semiconductor                 |
| DAC      | Digital-to-Analog Converter                             |
| DCSMU    | Device Configuration Management and Start-up Unit       |
| DES      | DESerializer                                            |
| EDGE     | Enhanced Data rates for GSM Evolution                   |
| FIR      | Finite Impulse Response                                 |
| FPGA     | Field Programmable Gate Array                           |
| GSM      | Global System for Mobile communications                 |
| IF       | Intermediate Frequency                                  |
| ILA      | Inter-Lane Alignment                                    |
| IMD3     | third order InterMoDulation product                     |
| LMDS     | Local Multipoint Distribution Service                   |
| LSB      | Least Significant Bit                                   |
| LTE      | Long Term Evolution                                     |
| LVDS     | Low-Voltage Differential Signaling                      |
| MDS      | Multipoint Distribution Service                         |
| MMDS     | Multichannel Multipoint Distribution Service            |
| MSB      | Most Significant Bit                                    |
| NCO      | Numerically Controlled Oscillator                       |
| NMOS     | Negative Metal-Oxide Semiconductor                      |
| PLL      | Phase-Locked Loop                                       |
| SERDES   | SERializer/DESerializer                                 |
| SFDR     | Spurious Free Dynamic Range                             |
| SPI      | Serial Peripheral Interface                             |
| TD-SCDMA | Time Division-Synchronous Code Division Multiple Access |
| WCDMA    | Wideband Code Division Multiple Access                  |
| WiMax    | Worldwide interoperability for Microwave Access         |
