

2.5V PHASE LOCKED LOOP CLOCK DRIVER

IDTCSPT855

FEATURES:

- PLL clock driver for DDR (Double Data Rate) synchronous DRAM applications
- Spread spectrum clock compatible
- Operating frequency: 60MHz to 220MHz
- Low jitter (cycle-to-cycle): $\pm 50\text{ps}$
- Distributes one differential clock input to four differential clock outputs
- Enters low power mode and 3-state outputs when input CLK signal is less than 20MHz or PWRDWN is low
- Operates from a 2.5V supply
- Consumes $<200\mu\text{A}$ quiescent current
- External feedback pins (FBIN, $\overline{\text{FBIN}}$) are used to synchronize outputs to input clocks
- Available in TSSOP package

APPLICATIONS:

- For all DDR1 speeds: PC1600 (DDR200), PC2100 (DDR266), PC2700 (DDR333), PC3200 (DDR400)

DESCRIPTION:

The CSPT855 is a high-performance, low-skew, low-jitter zero delay buffer that distributes one differential clock input pair (CLK, $\overline{\text{CLK}}$) to four differential output pairs (Y[0:3], $\overline{\text{Y}}[0:3]$) and one differential pair of feedback clock outputs (FBOUT, $\overline{\text{FBOUT}}$). When $\overline{\text{PWRDWN}}$ is high, the outputs switch in phase and frequency with CLK. When $\overline{\text{PWRDWN}}$ is low, all outputs are disabled to a high-impedance state (3-state), and the PLL is shut down (low-power mode). The device also enters this low-power mode when the input frequency falls below a suggested detection frequency that is below 20MHz (typical 10MHz). An input frequency detection circuit detects the low-frequency condition, and after applying a $>20\text{MHz}$ input signal, this detection circuit reactivates the PLL and enables the outputs.

When AV_{DD} is tied to GND, the PLL is turned off and bypassed for test purposes. The CSPT855 is also able to track spread spectrum clocking for reduced EMI.

Since the CSPT855 is based on PLL circuitry, it requires a stabilization time to achieve phase-lock of the PLL. This stabilization time is required following power up.

TIMING REQUIREMENTS

Symbol	Parameter	Min.	Max.	Unit
f_{CLK}	Operating Clock Frequency	60	220	MHz
t_{DC}	Input Clock Duty Cycle	40	60	%
t_L	Stabilization Time (PLL Mode) ⁽¹⁾	—	10	μs

NOTES:

1. Recovery time required when the device goes from power-down mode into bypass mode (test mode with AV_{DD} at GND).
2. Time required for the integrated PLL circuit to obtain phase lock of its feedback signal to its reference signal. For phase lock to be obtained, a fixed-frequency, fixed-phase reference signal must be present at CLK. Until phase lock is obtained, the specifications for propagation delay, skew, and jitter parameters given in the switching characteristics table are not applicable. This parameter does not apply for input modulation under SSC application.
