An external capacitor is required to block the DC bias voltage of internal circuit. (50~100MHz: 0.01uF, 0.1~0.5GHz: 1000pF, 0.5~2.5GHz: 56pF)                                                        |
| 2   | GND        | Ground terminal. Please connect this terminal with ground plane as close as possible for excellent RF performance.                                                                                                                                                                                                                                                       |

## PRECAUTIONS

- [1] The DC blocking capacitors have to be placed at RF terminal of P1, P2 and PC. Please choose appropriate capacitance values to the application frequency.
- [2]To reduce stlipline influence on RF characteristics, please locate bypass capacitors (C4, C5) close to each terminals.
- [3]For good isolation, the GND terminal (2<sup>nd</sup> pin) must be placed possibly close to ground plane of substrate, and through holes for GND should be placed near by the pin connection.
