

Automotive 8-bit ultra-low-power MCU, up to 32-Kbyte Flash, RTC, data EEPROM, LCD, timers, USART, I2C, SPI, ADC, DAC, COMPs

Datasheet production data

## Features

- AEC-Q100 qualified
  - Operating conditions
    - Operating power supply range 1.8 V to 3.6 V (down to 1.65 V at power down)
    - Temperature range: - 40 °C to 85 or 125 °C
  - Low power features
    - Five low-power modes: Wait, low-power run (5.1 µA), low-power wait (3 µA), active-halt with full RTC (1.3 µA), halt with PDR (400 nA)
    - Run from Flash: 195 µA/MHz + 440 µA
    - Run from RAM: 90 µA/MHz + 400 µA
    - Ultra-low leakage per I/O: 50 nA
    - Fast wakeup from Halt: 4.7 µs
  - Advanced STM8 core
    - Harvard architecture and 3-stage pipeline
    - Max freq. 16 MHz, 16 CISC MIPS peak
    - Up to 40 external interrupt sources
  - Reset and supply management
    - Low power, ultra safe BOR reset with 5 selectable thresholds
    - Ultra-low power POR/PDR
    - Programmable voltage detector (PVD)
  - Clock management
    - 1 to 16 MHz crystal oscillator
    - 32 kHz crystal oscillator
    - Internal 16 MHz factory-trimmed RC
    - Internal 38 kHz low consumption RC
    - Clock security system
  - Low power RTC
    - BCD calendar with alarm interrupt
    - Auto-wakeup from Halt (0.95 ppm resolution) w/ periodic interrupt
  - LCD: up to 4x28 segments w/ step-up converter
- 

LQFP48  
7 x 7 mm

LQFP32  
7 x 7 mm

VFQFPN32  
5 x 5 mm
- Memories
    - Program memory: up to 32 Kbyte Flash program; data retention 20 years at 55 °C
    - Data memory: up to 1 Kbyte true data EEPROM; endurance 300 kcycle
    - RAM: up to 2 Kbyte
  - DMA
    - Four channels; supported peripherals: ADC, DAC, SPI, I2C, USART, timers
    - One channel for memory-to-memory
  - 12-bit DAC with output buffer
  - 12-bit ADC up to 1 Mbps/25 channels
    - Temp sensor and internal reference voltage
  - Two ultra-low-power comparators
    - One with fixed threshold and one rail to rail
    - Wakeup capability
  - Timers
    - Two 16-bit timers with two channels (used as IC, OC, PWM), quadrature encoder
    - One 16-bit advanced control timer with three channels, supporting motor control
    - One 8-bit timer with 7-bit prescaler
    - Two watchdogs: one window, one independent
    - Beeper timer with 1-, 2- or 4 kHz frequencies
  - Communication interfaces
    - Synchronous serial interface (SPI)
    - Fast I2C 400 kHz SMBus and PMBus
    - USART (ISO 7816 interface, IrDA, LIN 1.3, LIN 2.0)
  - Up to 41 I/Os, all mappable on interrupt vectors

- Development support
  - Fast on-chip programming and non intrusive debugging with SWIM
  - Bootloader using USART
- 96-bit unique ID

**Table 1. Device summary**

| Reference                         | Part number                                                               |
|-----------------------------------|---------------------------------------------------------------------------|

# 1 Introduction

This document describes the features, pinout, mechanical data and ordering information of the medium-density STM8AL313x/4x/6x and STM8AL3L4x/6x devices (microcontrollers with up to 32-Kbyte Flash memory density). These devices are referred to as medium-density devices in STM8L051/L052 Value Line, STM8L151/L152, STM8L162, STM8AL31, STM8AL3L MCU lines reference manual (RM0031) and in STM8L and STM8AL Flash programming manual (PM0054).

For more details on the whole STMicroelectronics ultra-low-power family please refer to [Section 3: Functional overview on page 13](#).

For information on the debug module and SWIM (single wire interface module), refer to the STM8 SWIM communication protocol and debug module user manual (UM0470).

For information on the STM8 core, please refer to the STM8 CPU programming manual (PM0044).

*Note:* The medium-density devices provide the following benefits:

- Integrated system
  - Up to 32 Kbytes of medium-density embedded Flash program memory
  - 1 Kbytes of data EEPROM
  - Internal high speed and low-power low speed RC.
  - Embedded reset
- Ultra-low power consumption
  - 195  $\mu$ A/MHZ + 440  $\mu$ A (consumption)
  - 0.9  $\mu$ A with LSI in Active-halt mode
  - Clock gated system and optimized power management
  - Capability to execute from RAM for Low power wait mode and Low power run mode
- Advanced features
  - Up to 16 MIPS at 16 MHz CPU clock frequency
  - Direct memory access (DMA) for memory-to-memory or peripheral-to-memory access.
- Short development cycles
  - Application scalability across a common family product architecture with compatible pinout, memory map and modular peripherals.
  - Wide choice of development tools

All devices offer 12-bit ADC, DAC, two comparators, Real-time clock three 16-bit timers, one 8-bit timer as well as standard communication interface such as SPI, I2C and USART. A 4x28-segment LCD is available on the medium-density STM8AL3Lxx line. [Table 2: Medium-density STM8AL313x/4x/6x and STM8AL3L4x/6x low-power device features and peripheral counts](#) and [Section 3: Functional overview](#) give an overview of the complete range of peripherals proposed in this family.

[Figure 1](#) shows the general block diagram of the device family.

## 2 Description

The medium-density STM8AL313x/4x/6x and STM8AL3L4x/6x devices are members of the STM8AL automotive ultra-low-power 8-bit family. The medium-density STM8AL3xxx family operates from 1.8 V to 3.6 V (down to 1.65 V at power down) and is available in the -40 to +85°C and -40 to +125°C temperature ranges.

The medium-density STM8AL3xxx ultra-low-power family features the enhanced STM8 CPU core providing increased processing power (up to 16 MIPS at 16 MHz) while maintaining the advantages of a CISC architecture with improved code density, a 24-bit linear addressing space and an optimized architecture for low power operations.

The family includes an integrated debug module with a hardware interface (SWIM) which allows non-intrusive In-Application debugging and ultrafast Flash programming.

All medium-density STM8AL3xxx microcontrollers feature embedded data EEPROM and low power low-voltage single-supply program Flash memory.

They incorporate an extensive range of enhanced I/Os and peripherals.

The modular design of the peripheral set allows the same peripherals to be found in different ST microcontroller families including 32-bit families. This makes any transition to a different family very easy, and simplified even more by the use of a common set of development tools.

Two different packages are proposed which include 32 and 48 pins. Depending on the device chosen, different sets of peripherals are included.

All STM8AL3xxx ultra-low-power products are based on the same architecture with the same memory mapping and a coherent pinout.

## 2.1 Device overview

1. STM8AL3Lxx versions only

2. STM8AL31xx versions only

3. The number of GPIOs given in this table includes the NRST/PA1 pin but the application can use the NRST/PA1 pin as general purpose output only (PA1).

### 3 Functional overview

Figure 1. Medium-density STM8AL313x/4x/6x and STM8AL3L4x/6x device block diagram

1. **Legend:** ADC (Analog-to-digital converter), BOR (Brownout reset), DMA (Direct memory access), DAC (Digital-to-analog converter), I²C (Inter-integrated circuit multimaster interface), IWDG (Independent watchdog), LCD (Liquid crystal display), POR/PDR (Power on reset / power down reset), RTC (Real-time clock), SPI (Serial peripheral interface), SWIM (Single wire interface module), USART (Universal synchronous asynchronous receiver transmitter), WWDG (Window watchdog).

### 3.1 Low-power modes

The medium-density STM8AL313x/4x/6x and STM8AL3L4x/6x devices support five low-power modes to achieve the best compromise between low power consumption, short startup time and available wakeup sources:

- **Wait mode:** CPU clock is stopped, but selected peripherals keep running. An internal or external interrupt, event or a Reset can be used to exit the microcontroller from Wait mode (WFE or WFI mode). Wait consumption: refer to [Table 22](#).
- **Low power run mode:** The CPU and the selected peripherals are running. Execution is done from RAM with a low speed oscillator (LSI or LSE). Flash and data EEPROM are stopped and the voltage regulator is configured in ultra-low-power mode. The microcontroller enters Low power run mode by software and can exit from this mode by software or by a reset.  
All interrupts must be masked. They cannot be used to exit the microcontroller from this mode. Low power run mode consumption: refer to [Table 23](#).
- **Low power wait mode:** This mode is entered when executing a Wait for event in Low power run mode. It is similar to Low power run mode except that the CPU clock is stopped. The wakeup from this mode is triggered by a Reset or by an internal or external event (peripheral event generated by the timers, serial interfaces, DMA controller (DMA1), comparators and I/O ports). When the wakeup is triggered by an event, the system goes back to Low power run mode.  
All interrupts must be masked. They cannot be used to exit the microcontroller from this mode. Low power wait mode consumption: refer to [Table 24](#).
- **Active-halt mode:** CPU and peripheral clocks are stopped, except RTC. The wakeup can be triggered by RTC interrupts, external interrupts or reset. Active-halt consumption: refer to [Table 25](#) and [Table 26](#).
- **Halt mode:** CPU and peripheral clocks are stopped, the device remains powered on. The RAM content is preserved. The wakeup is triggered by an external interrupt or reset. A few peripherals have also a wakeup from Halt capability. Switching off the internal reference voltage reduces power consumption. Through software configuration it is also possible to wake up the device without waiting for the internal reference voltage wakeup time to have a fast wakeup time of 5  $\mu$ s. Halt consumption: refer to [Table 27](#).

## 3.2 Central processing unit STM8

### 3.2.1 Advanced STM8 core

The 8-bit STM8 core is designed for code efficiency and performance with an Harvard architecture and a 3-stage pipeline.

It contains six internal registers which are directly addressable in each execution context, 20 addressing modes including indexed indirect and relative addressing, and 80 instructions.

#### Architecture and registers

- Harvard architecture
- 3-stage pipeline
- 32-bit wide program memory bus - single cycle fetching most instructions
- X and Y 16-bit index registers - enabling indexed addressing modes with or without offset and read-modify-write type data manipulations
- 8-bit accumulator
- 24-bit program counter - 16 Mbyte linear memory space
- 16-bit stack pointer - access to a 64 Kbyte level stack
- 8-bit condition code register - 7 condition flags for the result of the last instruction

#### Addressing

- 20 addressing modes
- Indexed indirect addressing mode for lookup tables located anywhere in the address space
- Stack pointer relative addressing mode for local variables and parameter passing

#### Instruction set

- 80 instructions with 2-byte average instruction size
- Standard data movement and logic/arithmetic functions
- 8-bit by 8-bit multiplication
- 16-bit by 8-bit and 16-bit by 16-bit division
- Bit manipulation
- Data transfer between stack and accumulator (push/pop) with direct stack access
- Data transfer using the X and Y registers or direct memory-to-memory transfers

### 3.2.2 Interrupt controller

The medium-density STM8AL313x/4x/6x and STM8AL3L4x/6x feature a nested vectored interrupt controller:

- Nested interrupts with 3 software priority levels
- 32 interrupt vectors with hardware priority
- Up to 40 external interrupt sources on 11 vectors
- Trap and reset interrupts

## 3.3 Reset and supply management

### 3.3.1 Power supply scheme

The STM8AL313x/4x/6x and STM8AL3L4x/6x require a 1.65 V to 3.6 V operating supply voltage ( $V_{DD}$ ). The external power supply pins must be connected as follows:

- $V_{SS1}$ ;  $V_{DD1}$  = 1.8 V to 3.6 V, down to 1.65 V at power down: external power supply for I/Os and for the internal regulator. Provided externally through  $V_{DD1}$  pins, the corresponding ground pin is  $V_{SS1}$ .
- $V_{SSA}$ ;  $V_{DDA}$  = 1.8 V to 3.6 V, down to 1.65 V at power down: external power supplies for analog peripherals (minimum voltage to be applied to  $V_{DDA}$  is 1.8 V when the ADC1 is used).  $V_{DDA}$  and  $V_{SSA}$  must be connected to  $V_{DD1}$  and  $V_{SS1}$ , respectively.
- $V_{SS2}$ ;  $V_{DD2}$  = 1.8 V to 3.6 V, down to 1.65 V at power down: external power supplies for I/Os.  $V_{DD2}$  and  $V_{SS2}$  must be connected to  $V_{DD1}$  and  $V_{SS1}$ , respectively.
- $V_{REF+}$ ;  $V_{REF-}$  (for ADC1): external reference voltage for ADC1. Must be provided externally through  $V_{REF+}$  and  $V_{REF-}$  pin.
- $V_{REF+}$  (for DAC): external voltage reference for DAC must be provided externally through  $V_{REF+}$ .

### 3.3.2 Power supply supervisor

The STM8AL313x/4x/6x and STM8AL3L4x/6x have an integrated ZEROPOWER power-on reset (POR)/power-down reset (PDR), coupled with a brownout reset (BOR) circuitry. At power-on, BOR is always active, and ensures proper operation starting from 1.8 V. After the 1.8 V BOR threshold is reached, the option byte loading process starts, either to confirm or modify default thresholds, or to disable BOR permanently (in which case, the  $V_{DD}$  min value at power down is 1.65 V).

Five BOR thresholds are available through option bytes, starting from 1.8 V to 3 V. To reduce the power consumption in Halt mode, it is possible to automatically switch off the internal reference voltage (and consequently the BOR) in Halt mode. The device remains under reset when  $V_{DD}$  is below a specified threshold,  $V_{POR/PDR}$  or  $V_{BOR}$ , without the need for any external reset circuit.

The STM8AL313x/4x/6x and STM8AL3L4x/6x feature an embedded programmable voltage detector (PVD) that monitors the  $V_{DD}/V_{DDA}$  power supply and compares it to the  $V_{PVD}$  threshold. This PVD offers 7 different levels between 1.85 V and 3.05 V, chosen by software, with a step around 200 mV. An interrupt can be generated when  $V_{DD}/V_{DDA}$  drops below the  $V_{PVD}$  threshold and/or when  $V_{DD}/V_{DDA}$  is higher than the  $V_{PVD}$  threshold. The interrupt service routine can then generate a warning message and/or put the MCU into a safe state. The PVD is enabled by software.

### 3.3.3 Voltage regulator

The medium-density STM8AL313x/4x/6x and STM8AL3L4x/6x embed an internal voltage regulator for generating the 1.8 V power supply for the core and peripherals.

This regulator has two different modes:

- **Main voltage regulator mode (MVR)** for Run, Wait for interrupt (WFI) and Wait for event (WFE) modes.
- **Low power voltage regulator mode (LPVR)** for Halt, Active-halt, Low power run and Low power wait modes.

When entering Halt or Active-halt modes, the system automatically switches from the MVR to the LPVR in order to reduce current consumption.

## 3.4 Clock management

The clock controller distributes the system clock (SYSCLK) coming from different oscillators to the core and the peripherals. It also manages the clock gating for low-power modes and ensures clock robustness.

### Features

- **Clock prescaler:** to get the best compromise between speed and current consumption the clock frequency to the CPU and peripherals can be adjusted by a programmable prescaler.
- **Safe clock switching:** the clock sources can be changed safely on the fly in run mode through a configuration register.
- **Clock management:** to reduce power consumption, the clock controller can stop the clock to the core, individual peripherals or memory.
- **System clock sources:** four different clock sources can be used to drive the system clock:
  - 1-16 MHz High speed external crystal (HSE),
  - 16 MHz High speed internal RC oscillator (HSI),
  - 32.768 kHz Low speed external crystal (LSE),
  - 38 kHz Low speed internal RC (LSI).
- **RTC and LCD clock sources:** the above four sources can be chosen to clock the RTC and the LCD, whatever the system clock.
- **Startup clock:** After reset, the microcontroller restarts by default with an internal 2 MHz clock (HSI/8). The prescaler ratio and clock source can be changed by the application program as soon as the code execution starts.
- **Clock security system (CSS):** This feature can be enabled by software. If a HSE clock failure occurs, the system clock is automatically switched to HSI.
- **Configurable main clock output (CCO):** This outputs an external clock for use by the application.

**Figure 2. Medium-density STM8AL313x/4x/6x and STM8AL3L4x/6x clock tree diagram**

1. The HSE clock source can be either an external crystal/ceramic resonator or an external source (HSE bypass). Refer to *Section HSE clock* in STM8L051/L052 Value Line, STM8L151/L152, STM8L162, STM8AL31, STM8AL3L MCU lines reference manual (RM0031).
2. The LSE clock source can be either an external crystal/ceramic resonator or a external source (LSE bypass). Refer to *Section LSE clock* in STM8L051/L052 Value Line, STM8L151/L152, STM8L162, STM8AL31, STM8AL3L MCU lines reference manual (RM0031).

### 3.5 Low power real-time clock

The real-time clock (RTC) is an independent binary coded decimal (BCD) timer/counter.

Six byte locations contain the second, minute, hour (12/24 hour), week day, date, month, year, in BCD (binary coded decimal) format. Correction for 28, 29 (leap year), 30, and 31 day months are made automatically.

It provides a programmable alarm and programmable periodic interrupts with wakeup from Halt capability.

- Periodic wakeup time using the 32.768 kHz LSE with the lowest resolution (of 61  $\mu$ s) is from min. 122  $\mu$ s to max. 3.9 s. With a different resolution, the wakeup time can reach 36 hours.
- Periodic alarms based on the calendar can also be generated from every second to every year.

### 3.6 LCD (Liquid crystal display)

The liquid crystal display drives up to four common terminals and up to 28 segment terminals to drive up to 112 pixels.

- Internal step-up converter to guarantee contrast control whatever  $V_{DD}$ .
- Static 1/2, 1/3, 1/4 duty supported.
- Static 1/2, 1/3 bias supported.
- Phase inversion to reduce power consumption and EMI.
- Up to 4 pixels which can be programmed to blink.
- The LCD controller can operate in Halt mode.

*Note:* Unnecessary segments and common pins can be used as general I/O pins.

### 3.7 Memories

The medium-density STM8AL313x/4x/6x and STM8AL3L4x/6x devices have the following main features:

- Up to 2 Kbytes of RAM
- The non-volatile memory is divided into three arrays:
  - Up to 32 Kbytes of medium-density embedded Flash program memory
  - 1 Kbytes of Data EEPROM
  - Option bytes.

It supports the read-while-write (RWW): it is possible to execute the code from the program matrix while programming/erasing the data matrix.

The option byte protects part of the Flash program memory from write and readout piracy.

### 3.8 DMA

A 4-channel direct memory access controller (DMA1) offers a memory-to-memory and peripherals-from/to-memory transfer capability. The 4 channels are shared between the following IPs with DMA capability: ADC1, DAC, I2C1, SPI1, USART1, the 4 Timers.

### 3.9 Analog-to-digital converter

- 12-bit analog-to-digital converter (ADC1) with 25 channels (including 1 fast channel), temperature sensor and internal reference voltage
- Conversion time down to 1  $\mu$ s with  $f_{SYSCLK}$  = 16 MHz
- Programmable resolution
- Programmable sampling time
- Single and continuous mode of conversion
- Scan capability: automatic conversion performed on a selected group of analog inputs
- Analog watchdog
- Triggered by timer

*Note:* ADC1 can be served by DMA1.

### 3.10 Digital-to-analog converter (DAC)

- 12-bit DAC with output buffer
- Synchronized update capability using TIM4
- DMA capability
- External triggers for conversion
- Input reference voltage  $V_{REF+}$  for better resolution

*Note:* DAC can be served by DMA1.

### 3.11 Ultra-low-power comparators

The medium-density STM8AL313x/4x/6x and STM8AL3L4x/6x embed two comparators (COMP1 and COMP2) that share the same current bias and voltage reference. The voltage reference can be internal or external (coming from an I/O).

- One comparator with fixed threshold (COMP1).
- One comparator rail to rail with fast or slow mode (COMP2). The threshold can be one of the following:
  - DAC output,
  - External I/O,
  - Internal reference voltage or internal reference voltage sub multiple (1/4, 1/2, 3/4).

The two comparators can be used together to offer a window function. They can wake up from Halt mode.

### 3.12 System configuration controller and routing interface

The system configuration controller provides the capability to remap some alternate functions on different I/O ports. TIM4 and ADC1 DMA channels can also be remapped.

The highly flexible routing interface allows application software to control the routing of different I/Os to the TIM1 timer input captures. It also controls the routing of internal analog signals to ADC1, COMP1, COMP2, DAC and the internal reference voltage  $V_{REFINT}$ . It also provides a set of registers for efficiently managing the charge transfer acquisition sequence (see [Section 3.13: Timers](#)).

### 3.13 Timers

The medium-density STM8AL313x/4x/6x and STM8AL3L4x/6x devices contain one advanced control timer (TIM1), two 16-bit general purpose timers (TIM2 and TIM3) and one 8-bit basic timer (TIM4).

All the timers can be served by DMA1.

[Table 3](#) compares the features of the advanced control, general-purpose and basic timers.

**Table 3. Timer feature comparison**

| Timer | Counter resolution | Counter type | Prescaler factor               | DMA1 request generation | Capture/compare channels | Complementary outputs |
|-------|--------------------|--------------|--------------------------------|-------------------------|--------------------------|-----------------------|
| TIM1  | 16-bit             | up/down      | Any integer from 1 to 65536    | Yes                     | 3 + 1                    | 3                     |
| TIM2  |                    |              | Any power of 2 from 1 to 128   |                         | 2                        | None                  |
| TIM3  |                    |              |                                |                         |                          |                       |
| TIM4  | 8-bit              | up           | Any power of 2 from 1 to 32768 |                         | 0                        |                       |

#### 3.13.1 TIM1 - 16-bit advanced control timer

This is a high-end timer designed for a wide range of control applications. With its complementary outputs, dead-time control and center-aligned PWM capability, the field of applications is extended to motor control, lighting and half-bridge driver.

- 16-bit up, down and up/down auto reload counter with 16-bit prescaler
- Three independent capture/compare channels (CAPCOM) configurable as input capture, output compare, PWM generation (edge and center aligned mode) and single pulse mode output.
- One additional capture/compare channel which is not connected to an external I/O
- Synchronization module to control the timer with external signals
- Break input to force timer outputs into a defined state
- Three complementary outputs with adjustable dead time
- Encoder mode
- Interrupt capability on various events (capture, compare, overflow, break, trigger)

#### 3.13.2 16-bit general purpose timers

- 16-bit auto reload (AR) up/down-counter
- 7-bit prescaler adjustable to fixed power of 2 ratios (1...128)
- Two individually configurable capture/compare channels
- PWM mode
- Interrupt capability on various events (capture, compare, overflow, break, trigger)
- Synchronization with other timers or external signals (external clock, reset, trigger and enable)

### 3.13.3 8-bit basic timer

The 8-bit timer consists of an 8-bit up auto-reload counter driven by a programmable prescaler. It can be used for timebase generation with interrupt generation on timer overflow or for DAC trigger generation.

## 3.14 Watchdog timers

The watchdog system is based on two independent timers providing maximum security to the applications.

### 3.14.1 Window watchdog timer

The window watchdog (WWDG) is used to detect the occurrence of a software fault, usually generated by external interferences or by unexpected logical conditions, which cause the application program to abandon its normal sequence.

### 3.14.2 Independent watchdog timer

The independent watchdog peripheral (IWDG) can be used to resolve processor malfunctions due to hardware or software failures.

It is clocked by the internal LSI RC clock source, and thus stays active even in case of a CPU clock failure.

## 3.15 Beeper

The beeper function outputs a signal on the BEEP pin for sound generation. The signal is in the range of 1, 2 or 4 kHz.

## 3.16 Communication interfaces

### 3.16.1 SPI

The serial peripheral interface (SPI1) provides half/ full duplex synchronous serial communication with external devices.

- Maximum speed: 8 Mbit/s ( $f_{\text{SYSCLK}}/2$ ) both for master and slave
- Full duplex synchronous transfers
- Simplex synchronous transfers on 2 lines with a possible bidirectional data line
- Master or slave operation - selectable by hardware or software
- Hardware CRC calculation
- Slave/master selection input pin

*Note:* SPI1 can be served by the DMA1 Controller.

### 3.16.2 I<sup>2</sup>C

The I<sup>2</sup>C bus interface (I<sup>2</sup>C1) provides multi-master capability, and controls all I<sup>2</sup>C bus-specific sequencing, protocol, arbitration and timing.

- Master, slave and multi-master capability
- Standard mode up to 100 kHz and fast speed modes up to 400 kHz
- 7-bit and 10-bit addressing modes
- SMBus 2.0 and PMBus support
- Hardware CRC calculation

*Note:* I<sup>2</sup>C1 can be served by the DMA1 Controller.

### 3.16.3 USART

The USART interface (USART1) allows full duplex, asynchronous communications with external devices requiring an industry standard NRZ asynchronous serial data format. It offers a very wide range of baud rates.

- 1 Mbit/s full duplex SCI
- SPI1 emulation
- High precision baud rate generator
- SmartCard emulation
- IrDA SIR encoder decoder
- Single wire half duplex mode

*Note:* USART1 can be served by the DMA1 Controller.

USART1 can be used to implement LIN slave communication, with LIN Break detection on the framing error flag (FE in USART\_SR register) with a value of 0 in the USART data register (USART\_DR).

## 3.17 Infrared (IR) interface

The medium-density STM8AL313x/4x/6x and STM8AL3L4x/6x devices contain an infrared interface which can be used with an IR LED for remote control functions. Two timer output compare channels are used to generate the infrared remote control signals.

## 3.18 Development support

### Development tools

Development tools for the STM8 microcontrollers include:

- The STice emulation system offering tracing and code profiling
- The STVD high-level language debugger including C compiler, assembler and integrated development environment.
- The STVP Flash programming software

The STM8 also comes with starter kits, evaluation boards and low-cost in-circuit debugging/programming tools.

**Single wire data interface (SWIM) and debug module**

The debug module with its single wire data interface (SWIM) permits non-intrusive real-time in-circuit debugging and fast memory programming.

The Single wire interface is used for direct access to the debugging module and memory programming. The interface can be activated in all device operation modes.

The non-intrusive debugging module features a performance close to a full-featured emulator. Beside memory and peripherals, CPU operation can also be monitored in real-time by means of shadow registers.

**Bootloader**

A bootloader is available to reprogram the Flash memory using the USART1 interface. The reference document for the bootloader is *UM0560: STM8 bootloader user manual*.

- At power-up, the PA1/NRST pin is a reset input pin with pull-up. It is used as a general purpose pin (PA1) and can be configured only as output push-pull, not as output open drain or as a general purpose input. Refer to Section *Configuring NRST/PA1 pin as general purpose output* in STM8L051/L052 Value Line, STM8L151/L152, STM8L162, STM8AL31, STM8AL3L MCU lines reference manual (RM0031).
- Available on STM8AL3Lxx devices only.
- In the 3.6 V tolerant I/Os, protection diode to V<sub>DD</sub> is not implemented.
- [ ] Alternate function remapping option (if the same alternate function is shown twice, it indicates an exclusive choice not a duplication of the function).
- In the 5 V tolerant I/Os, protection diode to V<sub>DD</sub> is not implemented.
- A pull-up is applied to PB0 and PB4 during the reset phase. These two pins are input floating after reset release.
- In the open-drain output column, 'T' defines a true open-drain I/O (P-buffer, weak pull-up and protection diode to V<sub>DD</sub> are not implemented).
- Available on STM8AL31xx devices only.
- The PA0 pin is in input pull-up during the reset phase and after reset release.
- High sink LED driver capability available on PA0.

**Note:** The slope control of all GPIO pins, except true open drain pins, can be programmed. By default, the slope control is limited to 2 MHz.

## 4.1 System configuration options

As shown in [Table 5: Medium-density STM8AL313x/4x/6x and STM8AL3L4x/6x pin description](#), some alternate functions can be remapped on different I/O ports by programming one of the two remapping registers described in the “Routing interface (RI) and system configuration controller” section in STM8L051/L052 Value Line, STM8L151/L152, STM8L162, STM8AL31, STM8AL3L MCU lines reference manual (RM0031).

## 5 Memory and register map

### 5.1 Memory mapping

The memory map is shown in [Figure 9](#).

**Figure 9. Memory map**

1. [Table 6](#) lists the boundary addresses for each memory size. The top of the stack is at the RAM end address.
2. The VREFINT\_Factory\_CONV byte represents the LSB of the  $V_{REFINT}$  12-bit ADC conversion result. The MSB have a fixed value: 0x6.
3. The TS\_Factory\_CONV\_V125 byte represents the LSB of the  $V_{125}$  12-bit ADC conversion result. The MSB have a fixed value: 0x3. The  $V_{125}$  measurement is performed at 125°C.
4. Refer to [Table 9](#) for an overview of hardware register mapping, to [Table 8](#) for details on I/O port hardware registers, and to [Table 10](#) for information on CPU/SWIM/debug module controller registers.

Table 6. Flash and RAM boundary addresses

| Memory area          | Size     | Start address | End address |
|----------------------|----------|---------------|-------------|
| RAM                  | 2 Kbyte  | 0x00 0000     | 0x00 07FF   |
| Flash program memory | 8 Kbyte  | 0x00 8000     | 0x00 9FFF   |
|                      | 16 Kbyte |               | 0x00 BFFF   |
|                      | 32 Kbyte |               |             |

## 5.2 Register map

Table 7. Factory conversion registers

| Address   | Block | Register label                      | Register name                                 | Reset status |
|-----------|-------|-------------------------------------|-----------------------------------------------|--------------|
| 0x00 4910 | -     | VREFINT_Factory_CONV <sup>(1)</sup> | Internal reference voltage factory conversion | 0xXX         |
| 0x00 4911 | -     | TS_Factory_CONV_V125 <sup>(2)</sup> | Temperature sensor output voltage             | 0xXX         |

1. The VREFINT\_Factory\_CONV byte represents the 8 LSB of the result of the VREFINT 12-bit ADC conversion performed in factory. The MSB have a fixed value: 0x6.
2. The TS\_Factory\_CONV\_V125 byte represents the 8 LSB of the result of the V125 12-bit ADC conversion performed in factory. The 2 MSB have a fixed value: 0x3.

Table 8. I/O port hardware register map

| Address   | Block  | Register label | Register name                     | Reset status |
|-----------|--------|----------------|-----------------------------------|--------------|
| 0x00 5000 | Port A | PA_ODR         | Port A data output latch register | 0x00         |
| 0x00 5001 |        | PA_IDR         | Port A input pin value register   | 0xXX         |

1. The Low power wait mode is entered when executing a WFE instruction in Low power run mode. In WFE mode, the interrupt is served if it has been previously enabled. After processing the interrupt, the processor goes back to WFE mode. When the interrupt is configured as a wakeup event, the CPU wakes up and resumes processing.
2. The interrupt from PVD is logically OR-ed with Port E and F interrupts. Register EXT1\_CONF allows to select between Port E and Port F interrupt (see [External interrupt port select register \(EXT1\\_CONF\)](#) in STM8L051/L052 Value Line, STM8L151/L152, STM8L162, STM8AL31, STM8AL3L MCU lines reference manual (RM0031)).
3. The device is woken up from Halt or Active-halt mode only when the address received matches the interface address.

## 7 Option bytes

Option bytes contain configurations for device hardware features as well as the memory protection of the device. They are stored in a dedicated memory block.

All option bytes can be modified in ICP mode (with SWIM) by accessing the EEPROM address. See [Table 12](#) for details on option byte addresses.

The option bytes can also be modified 'on the fly' by the application in IAP mode, except for the ROP, and UBC values which can only be taken into account when they are modified in ICP mode (with the SWIM).

Refer to the STM8L15x/STM8L16x Flash programming manual (PM0054) and STM8 SWIM and Debug Manual (UM0320) for information on SWIM programming procedures.

**Table 12. Option byte addresses**

| Address   | Option name                                                      | Option byte No. | Option bits |   |   |   |             |          |             |          | Factory default setting |
|-----------|------------------------------------------------------------------|-----------------|-------------|---|---|---|-------------|----------|-------------|----------|-------------------------|

| OPTBL           | <b>OPTBL[15:0]:</b><br>This option is checked by the boot ROM code after reset. Depending on the content of addresses 0x00 480B, 0x00 480C and 0x8000 (reset vector) the CPU jumps to the bootloader or to the reset vector. Refer to the UM0560 bootloader user manual for more details. |

## 8 Unique ID

The devices feature a 96-bit unique device identifier which provides a reference number that is unique for any device and in any context. The 96 bits of the identifier can never be altered by the user.

The unique device identifier can be read in single bytes and may then be concatenated using a custom algorithm.

The unique device identifier is ideally suited:

- For use as serial numbers
- For use as security keys to increase the code security in the program memory while using and combining this unique ID with software cryptographic primitives and protocols before programming the internal memory.
- To activate secure boot processes

**Table 14. Unique ID registers (96 bits)**

| Address | Content description        | Unique ID bits |   |   |   |   |   |   |   |
|---------|----------------------------|----------------|---|---|---|---|---|---|---|
|         |                            | 7              | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| 0x4926  | X co-ordinate on the wafer | U_ID[7:0]      |   |   |   |   |   |   |   |
| 0x4927  |                            | U_ID[15:8]     |   |   |   |   |   |   |   |

## 9 Electrical parameters

### 9.1 Parameter conditions

Unless otherwise specified, all voltages are referred to  $V_{SS}$ .

#### 9.1.1 Minimum and maximum values

Unless otherwise specified the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at  $T_A = -40\text{ }^{\circ}\text{C}$ ,  $T_A = 25\text{ }^{\circ}\text{C}$ , and  $T_A = T_{A\text{max}}$  (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes and are not tested in production.

#### 9.1.2 Typical values

Unless otherwise specified, typical data are based on  $T_A = 25\text{ }^{\circ}\text{C}$ ,  $V_{DD} = 3\text{ V}$ . They are given only as design guidelines and are not tested.

Typical ADC and DAC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range.

#### 9.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

#### 9.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in [Figure 10](#).

**Figure 10. Pin loading conditions**

### 9.1.5 Pin input voltage

The input voltage measurement on a pin of the device is described in [Figure 11](#).

**Figure 11. Pin input voltage**

## 9.2 Absolute maximum ratings

Stresses above the absolute maximum ratings listed in [Table 15: Voltage characteristics](#), [Table 16: Current characteristics](#) and [Table 17: Thermal characteristics](#) may cause permanent damage to the device. These are stress ratings only and a functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect the device's reliability.

The device's mission profile (application conditions) is compliant with the JEDEC JESD47 qualification standard, extended mission profiles are available on demand.

**Table 15. Voltage characteristics**

| Symbol            | Ratings                                                                     | Min                                                                      | Max            | Unit |
|-------------------|-----------------------------------------------------------------------------|--------------------------------------------------------------------------|----------------|------|
| $V_{DD} - V_{SS}$ | External supply voltage (including $V_{DDA}$ and $V_{DD2}$ ) <sup>(1)</sup> | - 0.3                                                                    | 4.0            | V    |
| $V_{IN}^{(2)}$    | Input voltage on true open-drain pins (PC0 and PC1)                         | $V_{SS} - 0.3$                                                           | $V_{DD} + 4.0$ |      |
|                   | Input voltage on five-volt tolerant (FT) pins (PA7 and PE0)                 |                                                                          | 4.0            |      |
|                   | Input voltage on 3.6 V tolerant (TT) pins                                   |                                                                          |                |      |
|                   | Input voltage on any other pin                                              |                                                                          |                |      |
| $V_{ESD}$         | Electrostatic discharge voltage                                             | see <i>Absolute maximum ratings (electrical sensitivity) on page 106</i> |                | V    |

1. All power ( $V_{DD1}$ ,  $V_{DD2}$ ,  $V_{DDA}$ ) and ground ( $V_{SS1}$ ,  $V_{SS2}$ ,  $V_{SSA}$ ) pins must always be connected to the external power supply.
2.  $V_{IN}$  maximum must always be respected. Refer to [Table 16](#) for maximum allowed injected current values.

Table 16. Current characteristics

| Symbol                | Ratings                                                                       | Max.   | Unit |
|-----------------------|-------------------------------------------------------------------------------|--------|------|
| $I_{VDD}$             | Total current into $V_{DD}$ power line (source)                               | 80     | mA   |
| $I_{VSS}$             | Total current out of $V_{SS}$ ground line (sink)                              | 80     |      |
| $I_{IO}$              | Output current sunk by IR_TIM pin (with high sink LED driver capability)      | 80     |      |
|                       | Output current sunk by any other I/O and control pin                          | 25     |      |
|                       | Output current sourced by any I/Os and control pin                            | - 25   |      |
| $I_{INJ(PIN)}$        | Injected current on true open-drain pins (PC0 and PC1) <sup>(1)</sup>         | - 5/+0 |      |
|                       | Injected current on five-volt tolerant (FT) pins (PA7 and PE0) <sup>(1)</sup> | - 5/+0 |      |
|                       | Injected current on 3.6 V tolerant (TT) pins <sup>(1)</sup>                   | - 5/+0 |      |
|                       | Injected current on any other pin <sup>(2)</sup>                              | - 5/+5 |      |
| $\Sigma I_{INJ(PIN)}$ | Total injected current (sum of all I/O and control pins) <sup>(3)</sup>       | ± 25   |      |

1. Positive injection is not possible on these I/Os. A negative injection is induced by  $V_{IN} < V_{SS}$ .  $I_{INJ(PIN)}$  must never be exceeded. Refer to [Table 15](#) for maximum allowed input voltage values.
2. A positive injection is induced by  $V_{IN} > V_{DD}$  while a negative injection is induced by  $V_{IN} < V_{SS}$ .  $I_{INJ(PIN)}$  must never be exceeded. Refer to [Table 15](#) for maximum allowed input voltage values.
3. When several inputs are submitted to a current injection, the maximum  $\Sigma I_{INJ(PIN)}$  is the absolute sum of the positive and negative injected currents (instantaneous values).

Table 17. Thermal characteristics

| Symbol    | Ratings                      | Value       | Unit |
|-----------|------------------------------|-------------|------|
| $T_{STG}$ | Storage temperature range    | -65 to +150 | °C   |
| $T_J$     | Maximum junction temperature | 150         |      |

Table 18. Operating lifetime (OLF)<sup>(1)</sup>

| Symbol | Ratings                | Value         | Unit    |
|--------|------------------------|---------------|---------|
| OLF    | Conforming to AEC-Q100 | -40 to 125 °C | Grade 1 |

1. For detailed mission profile analysis, please contact the local ST Sales Office.

## 9.3 Operating conditions

Subject to general operating conditions for  $V_{DD}$  and  $T_A$ .

### 9.3.1 General operating conditions

Table 19. General operating conditions

| Symbol             | Parameter                                                       | Conditions                                                    | Min          | Max | Unit |
|--------------------|-----------------------------------------------------------------|---------------------------------------------------------------|--------------|-----|------|
| $f_{SYSCLK}^{(1)}$ | System clock frequency                                          | $1.65\text{ V} \leq V_{DD} < 3.6\text{ V}$                    | 0            | 16  | MHz  |
| $V_{DD}$           | Standard operating voltage                                      | -                                                             | $1.65^{(2)}$ | 3.6 | V    |
| $V_{DDA}$          | Analog operating voltage                                        | ADC and DAC not used                                          | $1.65^{(2)}$ | 3.6 | V    |
|                    |                                                                 | ADC and DAC used                                              | 1.8          | 3.6 | V    |
| $P_D^{(3)}$        | Power dissipation at $T_A = 85\text{ °C}$ for suffix A devices  | LQFP48                                                        | -            | 288 | mW   |
|                    |                                                                 | LQFP32                                                        | -            | 288 |      |

1.  $f_{SYSCLK} = f_{CPU}$

2. 1.8 V at power-up, 1.65 V at power-down if BOR is disabled

3. To calculate  $P_{Dmax}(T_A)$ , use the formula  $P_{Dmax} = (T_{Jmax} - T_A) / \Theta_{JA}$  with  $T_{Jmax}$  in this table and  $\Theta_{JA}$  in "Thermal characteristics" table.

### 9.3.2 Embedded reset and power control block characteristics

Table 20. Embedded reset and power control block characteristics

| Symbol     | Parameter               | Conditions           | Min               | Typ | Max            | Unit            |

1. Guaranteed by design.

2. Guaranteed by characterization results.

Figure 12. POR/BOR thresholds

### 9.3.3 Supply current characteristics

#### Total current consumption

The MCU is placed under the following conditions:

- All I/O pins in input mode with a static value at  $V_{DD}$  or  $V_{SS}$  (no load)
- All peripherals are disabled except if explicitly mentioned.

General conditions for  $V_{DD}$  apply,  $T_A = -40\text{ }^{\circ}\text{C}$  to  $125\text{ }^{\circ}\text{C}$ .

**Table 21. Total current consumption in Run mode**

| Symbol        | Parameter                                 | Conditions                                                                 |                                                         |                            | Typ  | Max                 | Unit          |

- CPU executing typical data processing
- The run from RAM consumption can be approximated with the linear formula:  
 $I_{DD(run\_from\_RAM)} = \text{Freq} * 90 \mu\text{A/MHz} + 400\mu\text{A}$
- Guaranteed by characterization results.
- Oscillator bypassed (HSEBYP = 1 in CLK\_ECKCR). When configured for external crystal, the HSE consumption ( $I_{DD HSE}$ ) must be added. Refer to [Table 32](#).
- The run from Flash consumption can be approximated with the linear formula:  
 $I_{DD(run\_from\_Flash)} = \text{Freq} * 195 \mu\text{A/MHz} + 440 \mu\text{A}$
- Oscillator bypassed (LSEBYP = 1 in CLK\_ECKCR). When configured for external crystal, the LSE consumption ( $I_{DD LSE}$ ) must be added. Refer to [Table 33](#).

Figure 13. Typ.  $I_{DD(RUN)}$  vs.  $V_{DD}$ ,  $f_{CPU} = 16 \text{ MHz}^{(1)}$ 

1. Typical current consumption measured with code executed from RAM.

Table 22. Total current consumption in Wait mode

1. No floating I/O, unless otherwise specified.
2. Guaranteed by characterization results.
3. RTC enabled. Clock source = LSI.
4. RTC enabled, LCD enabled with external  $V_{LCD} = 3\text{ V}$ , static duty, division ratio = 256, all pixels active, no LCD connected.
5. RTC enabled, LCD enabled with external  $V_{LCD}$ , 1/4 duty, 1/3 bias, division ratio = 64, all pixels active, no LCD connected.
6. LCD enabled with internal LCD booster  $V_{LCD} = 3\text{ V}$ , 1/4 duty, 1/3 bias, division ratio = 64, all pixels active, no LCD connected.
7. Oscillator bypassed (LSEBYP = 1 in CLK\_ECKCR). When configured for external crystal, the LSE consumption ( $I_{DD\text{ LSE}}$ ) must be added. Refer to [Table 33](#).
8. RTC enabled. Clock source = LSE.
9. Wakeup time until start of interrupt vector fetch.  
The first word of interrupt routine is fetched 4 CPU cycles after  $t_{WU}$ .
10. ULP=0 or ULP=1 and FWU=1 in the PWR\_CSR2 register.

**Table 26. Typical current consumption in Active-halt mode, RTC clocked by LSE external crystal**

1. Guaranteed by characterization results.

### HSE crystal/ceramic resonator oscillator

The HSE clock can be supplied with a 1 to 16 MHz crystal/ceramic resonator oscillator. All the information given in this paragraph is based on characterization results with specified typical external components. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details (frequency, package, accuracy...).

**Table 32. HSE oscillator characteristics**

| Symbol              | Parameter                                   | Conditions                         | Min                | Typ | Max                                               | Unit       |

|                     |                                             | $C = 10$ pF,<br>$f_{OSC} = 16$ MHz | -                  | -   | 2.5 (startup)<br>0.46 (stabilized) <sup>(3)</sup> |            |
| $g_m$               | Oscillator transconductance                 | -                                  | 3.5 <sup>(3)</sup> | -   | -                                                 | mA/V       |
| $t_{SU(HSE)}^{(4)}$ | Startup time                                | $V_{DD}$ is stabilized             | -                  | 1   | -                                                 | ms         |

1.  $C=C_{L1}=C_{L2}$  is approximately equivalent to  $2 \times$  crystal  $C_{LOAD}$ .
2. The oscillator selection can be optimized in terms of supply current using a high quality resonator with small  $R_m$  value. Refer to crystal manufacturer for more details
3. Guaranteed by design.
4.  $t_{SU(HSE)}$  is the startup time measured from the moment it is enabled (by software) to a stabilized 16 MHz oscillation. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer.

**Figure 15. HSE oscillator circuit diagram**

### HSE oscillator critical $g_m$ formula

$$g_{m_{crit}} = (2 \times \Pi \times f_{HSE})^2 \times R_m (2C_o + C)^2$$

Note:  $R_m$ : Motional resistance (see crystal specification),  $L_m$ : Motional inductance (see crystal specification),  $C_m$ : Motional capacitance (see crystal specification),  $C_o$ : Shunt capacitance (see crystal specification),  $C_{L1}=C_{L2}=C$ : Grounded external capacitance  
 $g_m \gg g_{mcrit}$

### LSE crystal/ceramic resonator oscillator

The LSE clock can be supplied with a 32.768 kHz crystal/ceramic resonator oscillator. All the information given in this paragraph is based on characterization results with specified typical external components. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details (frequency, package, accuracy...).

**Table 33. LSE oscillator characteristics**

1.  $V_{DD} = 3.0 \text{ V}$ ,  $T_A = -40$  to  $125^\circ\text{C}$  unless otherwise specified.

2. The trimming step differs depending on the trimming code. It is usually negative on the codes which are multiples of 16 (0x00, 0x10, 0x20, 0x30...0xE0). Refer to the AN3101 "STM8L05xxx/15xxx, STM8L162xx and STM8AL31xx/3Lxx internal RC oscillator calibration" application note for more details.

3. Guaranteed by design.

Figure 17. Typical HSI frequency vs  $V_{DD}$ 

### Low speed internal RC oscillator (LSI)

In the following table, data are based on characterization results, not tested in production.

Table 35. LSI oscillator characteristics

| Symbol        | Parameter <sup>(1)</sup>                      | Conditions <sup>(1)</sup>                                            | Min | Typ | Max                | Unit    |
|---------------|-----------------------------------------------|----------------------------------------------------------------------|-----|-----|--------------------|---------|
| $f_{LSI}$     | Frequency                                     | -                                                                    | 26  | 38  | 56                 | kHz     |
| $t_{su(LSI)}$ | LSI oscillator wakeup time                    | -                                                                    | -   | -   | 200 <sup>(2)</sup> | $\mu$ s |
| $I_{DD(LSI)}$ | LSI oscillator frequency drift <sup>(3)</sup> | $0\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$ | -12 | -   | 11                 | %       |

1.  $V_{DD} = 1.65\text{ V}$  to  $3.6\text{ V}$ ,  $T_A = -40$  to  $125\text{ }^{\circ}\text{C}$  unless otherwise specified.

2. Guaranteed by design.

3. This is a deviation for an individual part, once the initial frequency has been measured.

Figure 18. Typical LSI frequency vs.  $V_{DD}$ 

### 9.3.5 Memory characteristics

$T_A$  = -40 to 125 °C unless otherwise specified.

Table 36. RAM and hardware registers

| Symbol   | Parameter                          | Conditions           | Min  | Typ | Max | Unit |
|----------|------------------------------------|----------------------|------|-----|-----|------|
| $V_{RM}$ | Data retention mode <sup>(1)</sup> | Halt mode (or Reset) | 1.65 | -   | -   | V    |

1. Minimum supply voltage without losing data stored in RAM (in Halt mode or under Reset) or in hardware registers (only in Halt mode). Guaranteed by characterization results.

### Flash memory

Table 37. Flash program memory/data EEPROM memory

| Symbol     | Parameter                                                                              | Conditions                                           | Min  | Typ | Max | Unit |
|------------|----------------------------------------------------------------------------------------|------------------------------------------------------|------|-----|-----|------|
| $V_{DD}$   | Operating voltage<br>(all modes, read/write/erase)                                     | $f_{SYSCLK} = 16 \text{ MHz}$                        | 1.65 | -   | 3.6 | V    |
| $t_{prog}$ | Programming time for 1 or 128 bytes (block)<br>erase/write cycles (on programmed byte) | -                                                    | -    | 6   | -   | ms   |
|            | Programming time for 1 to 128 bytes (block)<br>write cycles (on erased byte)           | -                                                    | -    | 3   | -   |      |
| $I_{prog}$ | Programming/ erasing consumption                                                       | $T_A = +25^\circ\text{C}$ , $V_{DD} = 3.0 \text{ V}$ | -    | 0.7 | -   | mA   |
|            |                                                                                        | $T_A = +25^\circ\text{C}$ , $V_{DD} = 1.8 \text{ V}$ | -    |     | -   |      |

Table 38. Flash program memory

| Symbol    | Parameter                                                          | Conditions           | Min  | Max | Unit   |
|-----------|--------------------------------------------------------------------|----------------------|------|-----|--------|
| $T_{WE}$  | Temperature for writing and erasing                                | -                    | -40  | 125 | °C     |
| $N_{WE}$  | Flash program memory endurance (erase/write cycles) <sup>(1)</sup> | $T_A = 25\text{ °C}$ | 1000 | -   | cycles |
| $t_{RET}$ | Data retention time                                                | $T_A = 25\text{ °C}$ | 40   | -   | years  |
|           |                                                                    | $T_A = 55\text{ °C}$ | 20   | -   |        |

1. The physical granularity of the memory is four bytes, so cycling is performed on four bytes even when a write/erase operation addresses a single byte.

## Data memory

Table 39. Data memory

| Symbol    | Parameter                                                 | Conditions                          | Min                  | Max | Unit   |
|-----------|-----------------------------------------------------------|-------------------------------------|----------------------|-----|--------|
| $T_{WE}$  | Temperature for writing and erasing                       | -                                   | -40                  | 125 | °C     |
| $N_{WE}$  | Data memory endurance (erase/write cycles) <sup>(1)</sup> | $T_A = 25\text{ °C}$                | 300 k                | -   | cycles |
|           |                                                           | $T_A = -40\text{ to }125\text{ °C}$ | 100 k <sup>(2)</sup> | -   |        |
| $t_{RET}$ | Data retention time                                       | $T_A = 25\text{ °C}$                | 40 <sup>(2)(3)</sup> | -   | years  |
|           |                                                           | $T_A = 55\text{ °C}$                | 20 <sup>(2)(3)</sup> | -   |        |

1. The physical granularity of the memory is four bytes, so cycling is performed on four bytes even when a write/erase operation addresses a single byte.
2. More information on the relationship between data retention time and number of write/erase cycles is available in a separate technical document.
3. Retention time for 256B of data memory after up to 1000 cycles at 125 °C.

### 9.3.6 I/O current injection characteristics

As a general rule, current injection to the I/O pins, due to external voltage below  $V_{SS}$  or above  $V_{DD}$  (for standard pins) should be avoided during normal product operation. However, in order to give an indication of the robustness of the microcontroller in cases when abnormal injection accidentally happens, susceptibility tests are performed on a sample basis during device characterization.

#### Functional susceptibility to I/O current injection

While a simple application is executed on the device, the device is stressed by injecting current into the I/O pins programmed in floating input mode. While current is injected into the I/O pin, one at a time, the device is checked for functional failures.

The failure is indicated by an out of range parameter: ADC error, out of spec current injection on adjacent pins or other functional failure (for example reset, oscillator frequency deviation, LCD levels, etc.).

The test results are given in the following table.

Table 40. I/O current injection susceptibility

| Symbol           | Description                                            | Functional susceptibility |                    | Unit |
|------------------|--------------------------------------------------------|---------------------------|--------------------|------|
|                  |                                                        | Negative injection        | Positive injection |      |
| I <sub>INJ</sub> | Injected current on true open-drain pins (PC0 and PC1) | -5                        | +0                 | mA   |
|                  | Injected current on all five-volt tolerant (FT) pins   | -5                        | +0                 |      |
|                  | Injected current on all 3.6 V tolerant (TT) pins       | -5                        | +0                 |      |
|                  | Injected current on any other pin                      | -5                        | +5                 |      |

### 9.3.7 I/O port pin characteristics

#### General characteristics

Subject to general operating conditions for  $V_{DD}$  and  $T_A$  unless otherwise specified. All unused pins must be kept at a fixed voltage: using the output mode of the I/O for example or an external pull-up or pull-down resistor.

Table 41. I/O static characteristics

| Symbol           | Parameter                                         | Conditions <sup>(1)</sup>                                                                       | Min                    | Typ | Max                                 | Unit |
|------------------|---------------------------------------------------|-------------------------------------------------------------------------------------------------|------------------------|-----|-------------------------------------|------|
| V <sub>IL</sub>  | Input low level voltage                           | Input voltage on all pins                                                                       | V <sub>SS</sub> -0.3   | -   | 0.3 x V <sub>DD</sub>               | V    |

Table 41. I/O static characteristics (continued)

| Symbol   | Parameter                                       | Conditions <sup>(1)</sup> | Min               | Typ | Max               | Unit       |
|----------|-------------------------------------------------|---------------------------|-------------------|-----|-------------------|------------|
| $R_{PU}$ | Weak pull-up equivalent resistor <sup>(5)</sup> | $V_{IN} = V_{SS}$         | 30 <sup>(6)</sup> | 45  | 60 <sup>(6)</sup> | k $\Omega$ |
| $C_{IO}$ | I/O pin capacitance                             | -                         | -                 | 5   | -                 | pF         |

- $V_{DD} = 3.0$  V,  $T_A = -40$  to  $125$  °C unless otherwise specified.
- If  $V_{IH}$  maximum cannot be respected, the injection current must be limited externally to  $I_{INJ(PIN)}$  maximum.
- Hysteresis voltage between Schmitt trigger switching levels. Based on characterization results, not tested.
- The max. value may be exceeded if negative current is injected on adjacent pins.
- $R_{PU}$  pull-up equivalent resistor based on a resistive transistor (corresponding  $I_{PU}$  current characteristics described in [Figure 22](#)).
- Data not tested in production.

Figure 19. Typical  $V_{IL}$  and  $V_{IH}$  vs  $V_{DD}$  (high sink I/Os)

Figure 20. Typical  $V_{IL}$  and  $V_{IH}$  vs  $V_{DD}$  (true open drain I/Os)

Figure 21. Typical pull-up resistance  $R_{PU}$  vs  $V_{DD}$  with  $V_{IN}=V_{SS}$

Figure 22. Typical pull-up current  $I_{pu}$  vs  $V_{DD}$  with  $V_{IN}=V_{SS}$

**Output driving current**

Subject to general operating conditions for  $V_{DD}$  and  $T_A$  unless otherwise specified.

**Table 42. Output driving current (high sink ports)**

| I/O Type  | Symbol         | Parameter                                | Conditions                                              | Min           | Max  | Unit |
|-----------|----------------|------------------------------------------|---------------------------------------------------------|---------------|------|------|
| High sink | $V_{OL}^{(1)}$ | Output low level voltage for an I/O pin  | $I_{IO} = +2 \text{ mA}$ ,<br>$V_{DD} = 3.0 \text{ V}$  | -             | 0.45 | V    |

1. Guaranteed by characterization results.

2. 200 mV min.

3. Guaranteed by design.

**Figure 29. Typical NRST pull-up resistance  $R_{PU}$  vs  $V_{DD}$** 

Figure 30. Typical NRST pull-up current  $I_{pu}$  vs  $V_{DD}$ 

The reset network shown in [Figure 31](#) protects the device against parasitic resets. The user must ensure that the level on the NRST pin can go below the  $V_{IL}$  max. level specified in [Table 45](#). Otherwise the reset is not taken into account internally.

For power consumption sensitive applications, the external reset capacitor value can be reduced to limit the charge/discharge current. If the NRST signal is used to reset the external circuitry, attention must be paid to the charge/discharge time of the external capacitor to fulfill the external devices reset timing conditions. The minimum recommended capacity is 10 nF.

Figure 31. Recommended NRST pin configuration

### 9.3.8 Communication interfaces

#### SPI1 - Serial peripheral interface

Unless otherwise specified, the parameters given in [Table 46](#) are derived from tests performed under ambient temperature,  $f_{\text{SYSCLK}}$  frequency and  $V_{\text{DD}}$  supply voltage conditions summarized in [Section 9.3.1](#). Refer to I/O port characteristics for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO).

**Table 46. SPI1 characteristics**

- Parameters are given by selecting 10 MHz I/O output frequency.
- Values based on design simulation and/or characterization results, and not tested in production.
- Min time is for the minimum time to drive the output and max time is for the maximum time to validate the data.
- Min time is for the minimum time to invalidate the output and max time is for the maximum time to put the data in Hi-Z.

## I<sup>2</sup>C - Inter IC control interface

Subject to general operating conditions for  $V_{DD}$ ,  $f_{SYSCLK}$ , and  $T_A$  unless otherwise specified.

The STM8AL I<sup>2</sup>C interface (I2C1) meets the requirements of the Standard I<sup>2</sup>C communication protocol described in the following table with the restriction mentioned below:

Refer to I/O port characteristics for more details on the input/output alternate function characteristics (SDA and SCL).

Table 47. I<sup>2</sup>C characteristics

| Symbol        | Parameter           | Standard mode I <sup>2</sup> C |                    | Fast mode I <sup>2</sup> C <sup>(1)</sup> |                    | Unit    |

1. f<sub>SYSCLOCK</sub> must be at least equal to 8 MHz to achieve max fast I<sup>2</sup>C speed (400 kHz).

2. Data based on standard I<sup>2</sup>C protocol requirements, not tested in production.

Note:

For speeds around 200 kHz, the achieved speed can have a ± 5% tolerance

For other speed ranges, the achieved speed can have a ± 2% tolerance

The above variations depend on the accuracy of the external components used.

Figure 35. Typical application with I<sup>2</sup>C bus and timing diagram<sup>(1)</sup>

1. Measurement points are done at CMOS levels: 0.3 x V<sub>DD</sub> and 0.7 x V<sub>DD</sub>

### 9.3.9 LCD controller (STM8AL3Lxx only)

In the following table, data are guaranteed by design and are not tested in production.

**Table 48. LCD characteristics**

| Symbol         | Parameter                                         | Min | Typ            | Max.       | Unit       |
|----------------|---------------------------------------------------|-----|----------------|------------|------------|
| $V_{LCD}$      | LCD external voltage                              | -   | -              | 3.6        | V          |
| $V_{LCD0}$     | LCD internal reference voltage 0                  | -   | 2.6            | -          |            |
| $V_{LCD1}$     | LCD internal reference voltage 1                  | -   | 2.7            | -          |            |
| $V_{LCD2}$     | LCD internal reference voltage 2                  | -   | 2.8            | -          |            |
| $V_{LCD3}$     | LCD internal reference voltage 3                  | -   | 2.9            | -          |            |
| $V_{LCD4}$     | LCD internal reference voltage 4                  | -   | 3.0            | -          |            |
| $V_{LCD5}$     | LCD internal reference voltage 5                  | -   | 3.1            | -          |            |
| $V_{LCD6}$     | LCD internal reference voltage 6                  | -   | 3.2            | -          |            |
| $V_{LCD7}$     | LCD internal reference voltage 7                  | -   | 3.3            | -          |            |
| $C_{EXT}$      | $V_{LCD}$ external capacitance                    | 0.1 | -              | 2          | $\mu F$    |
| $I_{DD}$       | Supply current <sup>(1)</sup> at $V_{DD} = 1.8 V$ | -   | 3              | -          | $\mu A$    |
|                | Supply current <sup>(1)</sup> at $V_{DD} = 3 V$   | -   | 3              | -          |            |
| $R_{HN}^{(2)}$ | High value resistive network (low drive)          | -   | 6.6            | -          | M $\Omega$ |
| $R_{LN}^{(3)}$ | Low value resistive network (high drive)          | -   | 360            | -          | k $\Omega$ |
| $V_{33}$       | Segment/Common higher level voltage               | -   | -              | $V_{LCDx}$ | V          |
| $V_{23}$       | Segment/Common 2/3 level voltage                  | -   | $2/3 V_{LCDx}$ | -          |            |
| $V_{12}$       | Segment/Common 1/2 level voltage                  | -   | $1/2 V_{LCDx}$ | -          |            |
| $V_{13}$       | Segment/Common 1/3 level voltage                  | -   | $1/3 V_{LCDx}$ | -          |            |
| $V_0$          | Segment/Common lowest level voltage               | 0   | -              | -          |            |

1. LCD enabled with 3 V internal booster (LCD\_CR1 = 0x08), 1/4 duty, 1/3 bias, division ratio= 64, all pixels active, no LCD connected.

2.  $R_{HN}$  is the total high value resistive network.

3.  $R_{LN}$  is the total low value resistive network.

### VLCD external capacitor (STM8AL3Lxx only)

The application can achieve a stabilized LCD reference voltage by connecting an external capacitor  $C_{EXT}$  to the  $V_{LCD}$  pin.  $C_{EXT}$  is specified in [Table 48](#).

### 9.3.10 Embedded reference voltage

In the following table, data are based on characterization results, not tested in production, unless otherwise specified.

Table 49. Reference voltage characteristics

| Symbol                    | Parameter                                                                                | Conditions                                  | Min                  | Typ   | Max.                 | Unit            |
|---------------------------|------------------------------------------------------------------------------------------|---------------------------------------------|----------------------|-------|----------------------|-----------------|
| $I_{REFINT}$              | Internal reference voltage consumption                                                   | -                                           | -                    | 1.4   | -                    | $\mu A$         |
| $T_{S\_VREFINT}^{(1)(2)}$ | ADC sampling time when reading the internal reference voltage                            | -                                           | -                    | 5     | 10                   | $\mu s$         |
| $I_{BUF}^{(2)}$           | Internal reference voltage buffer consumption (used for ADC)                             | -                                           | -                    | 13.5  | 25                   | $\mu A$         |
| $V_{REFINT\ out}$         | Reference voltage output                                                                 | -                                           | 1.202 <sub>(3)</sub> | 1.224 | 1.242 <sub>(3)</sub> | V               |
| $I_{LPBUF}^{(2)}$         | Internal reference voltage low power buffer consumption (used for comparators or output) | -                                           | -                    | 730   | 1200                 | nA              |
| $I_{REFOUT}^{(2)}$        | Buffer output current <sup>(4)</sup>                                                     | -                                           | -                    | -     | 1                    | $\mu A$         |
| $C_{REFOUT}$              | Reference voltage output load                                                            | -                                           | -                    | -     | 50                   | pF              |
| $t_{VREFINT}$             | Internal reference voltage startup time                                                  | -                                           | -                    | 2     | 3                    | ms              |
| $t_{BUFEN}^{(2)}$         | Internal reference voltage buffer startup time once enabled <sup>(1)</sup>               | -                                           | -                    | -     | 10                   | $\mu s$         |
| $ACC_{VREFINT}$           | Accuracy of $V_{REFINT}$ stored in the $VREFINT\_Factory\_CONV$ byte <sup>(5)</sup>      | -                                           | -                    | -     | $\pm 5$              | mV              |
| $STAB_{VREFINT}^{(2)}$    | Stability of $V_{REFINT}$ over temperature                                               | $-40\ ^\circ C \leq T_A \leq 125\ ^\circ C$ | -                    | 20    | 50                   | ppm/ $^\circ C$ |
|                           | Stability of $V_{REFINT}$ over temperature                                               | $0\ ^\circ C \leq T_A \leq 50\ ^\circ C$    | -                    | -     | 20                   |                 |
| $STAB_{VREFINT}^{(2)}$    | Stability of $V_{REFINT}$ after 1000 hours                                               | -                                           | -                    | -     | 1000                 | ppm             |

1. Defined when ADC output reaches its final value  $\pm 1/2LSB$

2. Guaranteed by design.

3. Tested in production at  $V_{DD} = 3\ V \pm 10\ mV$ .

4. To guaranty less than 1%  $V_{REFOUT}$  deviation.

5. Measured at  $V_{DD} = 3\ V \pm 10\ mV$ . This value takes into account  $V_{DD}$  accuracy and ADC conversion accuracy.

### 9.3.11 Temperature sensor

In the following table, data are based on characterization results, not tested in production, unless otherwise specified.

Table 50. TS characteristics

| Symbol          | Parameter                                                   | Min                 | Typ     | Max.                | Unit           |
|-----------------|-------------------------------------------------------------|---------------------|---------|---------------------|----------------|
| $V_{125}^{(1)}$ | Sensor reference voltage at $125\ ^\circ C \pm 5\ ^\circ C$ | 0.640               | 0.660   | 0.680               | V              |
| $T_L$           | $V_{SENSOR}$ linearity with temperature                     | -                   | $\pm 1$ | $\pm 2$             | $^\circ C$     |
| Avg_slope       | Average slope                                               | 1.59 <sup>(2)</sup> | 1.62    | 1.65 <sup>(2)</sup> | mV/ $^\circ C$ |
| $I_{DD(TEMP)}$  | Consumption                                                 | -                   | 3.4     | 6 <sup>(2)</sup>    | $\mu A$        |

Table 50. TS characteristics (continued)

| Symbol            | Parameter                                             | Min | Typ | Max.       | Unit    |
|-------------------|-------------------------------------------------------|-----|-----|------------|---------|
| $T_{START}^{(3)}$ | Temperature sensor startup time                       | -   | -   | $10^{(2)}$ | $\mu s$ |
| $T_{S\_TEMP}$     | ADC sampling time when reading the temperature sensor | -   | 5   | $10^{(2)}$ |         |

1. Tested in production at  $V_{DD} = 3 V \pm 10 mV$ . The 8 LSB of the  $V_{125}$  ADC conversion result are stored in the  $TS\_Factory\_CONV\_V125$  byte.

2. Guaranteed by design.

3. Defined for ADC output reaching its final value  $\pm 1/2LSB$ .

### 9.3.12 Comparator characteristics

In the following table, data are guaranteed by design, not tested in production, unless otherwise specified.

Table 51. Comparator 1 characteristics

| Symbol       | Parameter                        | Min   | Typ     | Max             | Unit        |
|--------------|----------------------------------|-------|---------|-----------------|-------------|
| $V_{DDA}$    | Analog supply voltage            | 1.65  | -       | $3.6^{(1)}$     | V           |
| $T_A$        | Temperature range                | -40   | -       | $125^{(1)}$     | $^{\circ}C$ |
| $R_{400K}$   | $R_{400K}$ value                 | 300   | 400     | $500^{(1)}$     | $k\Omega$   |
| $R_{10K}$    | $R_{10K}$ value                  | 7.5   | 10      | $12.5^{(1)}$    |             |
| $V_{IN}$     | Comparator input voltage range   | 0.6   | -       | $V_{DDA}^{(1)}$ | V           |
| $V_{REFINT}$ | Internal reference voltage       | 1.202 | 1.224   | 1.242           |             |
| $t_{START}$  | Startup time after enable        | -     | 7       | $10^{(1)}$      | $\mu s$     |
| $t_d$        | Propagation delay <sup>(2)</sup> | -     | 3       | $10^{(1)}$      |             |
| $V_{offset}$ | Comparator offset error          | -     | $\pm 3$ | $\pm 10^{(1)}$  | mV          |
| $I_{CMP1}$   | Consumption <sup>(3)</sup>       | -     | 160     | $260^{(1)}$     | nA          |

1. Guaranteed by characterization results.

2. The delay is characterized for 100 mV input step with 10 mV overdrive on the inverting input, the non-inverting input set to the reference.

3. Comparator consumption only. Internal reference voltage not included.

In the following table, data are guaranteed by design, not tested in production unless otherwise specified.

**Table 52. Comparator 2 characteristics**

| Symbol        | Parameter                                     | Conditions                         | Min  | Typ     | Max <sup>(1)</sup> | Unit    |
|---------------|-----------------------------------------------|------------------------------------|------|---------|--------------------|---------|
| $V_{DDA}$     | Analog supply voltage                         | -                                  | 1.65 | -       | 3.6                | V       |
| $T_A$         | Temperature range                             | -                                  | -40  | -       | 125                | °C      |
| $V_{IN}$      | Comparator 2 input voltage range              | -                                  | 0    | -       | $V_{DDA}$          | V       |
| $t_{START}$   | Comparator startup time                       | Fast mode                          | -    | 15      | 20                 | $\mu s$ |
|               |                                               | Slow mode                          | -    | 20      | 25                 |         |
| $t_{d\ slow}$ | Propagation delay in slow mode <sup>(2)</sup> | $1.65\ V \leq V_{DDA} \leq 2.7\ V$ | -    | 1.8     | 3.5                |         |
|               |                                               | $2.7\ V \leq V_{DDA} \leq 3.6\ V$  |      | 2.5     | 6                  |         |
| $t_{d\ fast}$ | Propagation delay in fast mode <sup>(2)</sup> | $1.65\ V \leq V_{DDA} \leq 2.7\ V$ | -    | 0.8     | 2                  |         |
|               |                                               | $2.7\ V \leq V_{DDA} \leq 3.6\ V$  |      | 1.2     | 4                  |         |
| $V_{offset}$  | Comparator offset error                       | -                                  | -    | $\pm 4$ | $\pm 20$           | mV      |
| $I_{COMP2}$   | Current consumption <sup>(3)</sup>            | Fast mode                          | -    | 3.5     | 5                  | $\mu A$ |
|               |                                               | Slow mode                          |      | 0.5     | 2                  |         |

1. Guaranteed by characterization results.

2. The delay is characterized for 100 mV input step with 10 mV overdrive on the inverting input, the non-inverting input set to the reference.

3. Comparator consumption only. Internal reference voltage not included.

### 9.3.13 12-bit DAC characteristics

In the following table, data are guaranteed by design, not tested in production.

**Table 53. DAC characteristics**

| Symbol     | Parameter                | Conditions | Min | Typ | Max       | Unit |
|------------|--------------------------|------------|-----|-----|-----------|------|
| $V_{DDA}$  | Analog supply voltage    | -          | 1.8 | -   | 3.6       | V    |
| $V_{REF+}$ | Reference supply voltage | -          | 1.8 | -   | $V_{DDA}$ |      |

Table 53. DAC characteristics (continued)

| Symbol         | Parameter                                                                                                                                                      | Conditions                                       | Min | Typ | Max                | Unit        |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------|-----|-----|--------------------|-------------|
| $I_{VREF}$     | Current consumption on $V_{REF+}$ supply                                                                                                                       | $V_{REF+} = 3.3$ V, no load, middle code (0x800) | -   | 130 | 220                | $\mu A$     |
|                |                                                                                                                                                                | $V_{REF+} = 3.3$ V, no load, worst code (0x000)  | -   | 220 | 350                |             |
| $I_{VDDA}$     | Current consumption on $V_{DDA}$ supply                                                                                                                        | $V_{DDA} = 3.3$ V, no load, middle code (0x800)  | -   | 210 | 320                |             |
|                |                                                                                                                                                                | $V_{DDA} = 3.3$ V, no load, worst code (0x000)   | -   | 320 | 520                |             |
| $T_A$          | Temperature range                                                                                                                                              | -                                                | -40 | -   | 125                | $^{\circ}C$ |
| $R_L$          | Resistive load <sup>(1) (2)</sup>                                                                                                                              | DACOUT buffer ON                                 | 5   | -   | -                  | $k\Omega$   |
| $R_O$          | Output impedance                                                                                                                                               | DACOUT buffer OFF                                | -   | 8   | 10                 |             |

| DAC_OUT        | DAC_OUT voltage <sup>(4)</sup>                                                                                                                                 | DACOUT buffer ON                                 | 0.2 | -   | $V_{DDA}-0.2$      | V           |
|                |                                                                                                                                                                | DACOUT buffer OFF                                | 0   | -   | $V_{REF+} - 1$ LSB |             |
| $t_{settling}$ | Settling time (full scale: for a 12-bit input code transition between the lowest and the highest input codes when DAC_OUT reaches the final value $\pm 1$ LSB) | $R_L \geq 5$ k $\Omega$ ,<br>$C_L \leq 50$ pF    | -   | 7   | 12                 | $\mu s$     |
| Update rate    | Max frequency for a correct DAC_OUT (@95%) change when small variation of the input code (from code i to i+1LSB).                                              | $R_L \geq 5$ k $\Omega$ ,<br>$C_L \leq 50$ pF    | -   | -   | 1                  | Msp/s       |
| $t_{WAKEUP}$   | Wakeup time from OFF state. Input code between lowest and highest possible codes.                                                                              | $R_L \geq 5$ k $\Omega$ ,<br>$C_L \leq 50$ pF    | -   | 9   | 15                 | $\mu s$     |
| PSRR+          | Power supply rejection ratio (to $V_{DDA}$ ) (static DC measurement)                                                                                           | $R_L \geq 5$ k $\Omega$ ,<br>$C_L \leq 50$ pF    | -   | -60 | -35                | dB          |

1. Resistive load between DACOUT and GNDA.

2. Output on PF0 (48-pin package only).

3. Capacitive load at DACOUT pin.

4. It gives the output excursion of the DAC.

In the following table, data based on characterization results, not tested in production.

**Table 54. DAC accuracy**

| Symbol     | Parameter                                 | Conditions                                                                              | Typ.      | Max <sup>(1)</sup> | Unit       |
|------------|-------------------------------------------|-----------------------------------------------------------------------------------------|-----------|--------------------|------------|
| DNL        | Differential non linearity <sup>(2)</sup> | $R_L \geq 5\text{ k}\Omega$ , $C_L \leq 50\text{ pF}$ , DACOUT buffer ON <sup>(3)</sup> | 1.5       | 3                  | 12-bit LSB |
|            |                                           | No load, DACOUT buffer OFF                                                              | 1.5       | 3                  |            |

| Offset     | Offset error <sup>(5)</sup>               | $R_L \geq 5\text{ k}\Omega$ , $C_L \leq 50\text{ pF}$ , DACOUT buffer ON <sup>(3)</sup> | $\pm 10$  | $\pm 25$           |            |
|            |                                           | No load, DACOUT buffer OFF                                                              | $\pm 5$   | $\pm 8$            |            |
| Offset1    | Offset error at Code 1 <sup>(6)</sup>     | DACOUT buffer OFF                                                                       | $\pm 1.5$ | $\pm 5$            |            |
| Gain error | Gain error <sup>(7)</sup>                 | $R_L \geq 5\text{ k}\Omega$ , $C_L \leq 50\text{ pF}$ , DACOUT buffer ON <sup>(3)</sup> | +0.1/-0.2 | +0.2/-0.5          | %          |
|            |                                           | No load, DACOUT buffer OFF                                                              | +0/-0.2   | +0/-0.4            |            |
| TUE        | Total unadjusted error                    | $R_L \geq 5\text{ k}\Omega$ , $C_L \leq 50\text{ pF}$ , DACOUT buffer ON <sup>(3)</sup> | 12        | 30                 | 12-bit LSB |
|            |                                           | No load, DACOUT buffer OFF                                                              | 8         | 12                 |            |

1. Not tested in production.

2. Difference between two consecutive codes - 1 LSB.

3. For 48-pin packages only. For 28-pin and 32-pin packages, DAC output buffer must be kept off and no load must be applied.

4. Difference between measured value at Code i and the value at Code i on a line drawn between Code 0 and last Code 1023.

5. Difference between the value measured at Code (0x800) and the ideal value =  $V_{REF+}/2$ .

6. Difference between the value measured at Code (0x001) and the ideal value.

7. Difference between the ideal slope of the transfer function and the measured slope computed from Code 0x000 and 0xFFFF when buffer is ON, and from Code giving 0.2 V and ( $V_{DDA} - 0.2$ ) V when buffer is OFF.

In the following table, data are guaranteed by design, not tested in production.

**Table 55. DAC output on PB4-PB5-PB6<sup>(1)</sup>**

| Symbol    | Parameter                                                     | Conditions                             | Max | Unit       |
|-----------|---------------------------------------------------------------|----------------------------------------|-----|------------|
| $R_{int}$ | Internal resistance between DAC output and PB4-PB5-PB6 output | $2.7\text{ V} < V_{DD} < 3.6\text{ V}$ | 1.4 | k $\Omega$ |
|           |                                                               | $2.4\text{ V} < V_{DD} < 3.6\text{ V}$ | 1.6 |            |
|           |                                                               | $2.0\text{ V} < V_{DD} < 3.6\text{ V}$ | 3.2 |            |
|           |                                                               | $1.8\text{ V} < V_{DD} < 3.6\text{ V}$ | 8.2 |            |

1. 32 or 28-pin packages only. The DAC channel can be routed either on PB4, PB5 or PB6 using the routing interface I/O switch registers.

### 9.3.14 12-bit ADC1 characteristics

In the following table, data are guaranteed by design, not tested in production.

Table 56. ADC1 characteristics

| Symbol             | Parameter                                  | Conditions                                       | Min              | Typ  | Max                          | Unit                   |
|--------------------|--------------------------------------------|--------------------------------------------------|------------------|------|------------------------------|------------------------|
| V <sub>DDA</sub>   | Analog supply voltage                      | -                                                | 1.8              | -    | 3.6                          | V                      |
| V <sub>REF+</sub>  | Reference supply voltage                   | 2.4 V ≤ V <sub>DDA</sub> ≤ 3.6 V                 | 2.4              | -    | V <sub>DDA</sub>             |                        |
|                    |                                            | 1.8 V ≤ V <sub>DDA</sub> ≤ 2.4 V                 | V <sub>DDA</sub> |      |                              |                        |
| V <sub>REF-</sub>  | Lower reference voltage                    | -                                                | V <sub>SSA</sub> |      |                              |                        |
| I <sub>VDDA</sub>  | Current on the V <sub>DDA</sub> input pin  | -                                                | -                | 1000 | 1450                         | μA                     |
| I <sub>VREF+</sub> | Current on the V <sub>REF+</sub> input pin | -                                                | -                | 400  | 700 (peak) <sup>(1)</sup>    |                        |
|                    |                                            | -                                                | -                |      | 450 (average) <sup>(1)</sup> |                        |

| $t_{WKUP}$       | Wakeup time from OFF state              | -                                                                              | -                                                                          | -   | 3                                 |               |
| $t_{IDLE}^{(7)}$ | Time before a new conversion            | -                                                                              | -                                                                          | -   | $\infty$                          | s             |
| $t_{VREFINT}$    | Internal reference voltage startup time | -                                                                              | -                                                                          | -   | refer to <a href="#">Table 49</a> | ms            |

- The current consumption through  $V_{REF}$  is composed of two parameters:
  - one constant (max 300  $\mu\text{A}$ )
  - one variable (max 400  $\mu\text{A}$ ), only during sampling time + 2 first conversion pulses.
 So, peak consumption is  $300+400 = 700\text{ }\mu\text{A}$  and average consumption is  $300 + [(4\text{ sampling} + 2) / 16] \times 400 = 450\text{ }\mu\text{A}$  at 1Msps
- $V_{REF}$ - or  $V_{DDA}$  must be tied to ground.
- Guaranteed by design.
- Minimum sampling and conversion time is reached for maximum  $R_{ext} = 0.5\text{ k}\Omega$ .
- Value obtained for continuous conversion on fast channel.
- $\text{SAR\_internal\_cycles}=12$  and  $\text{Sampling\_cycles}=4;9;16;24;48;96;192$  or 384 depending on  $\text{SMP1}[2:0]$ .
- In STM8L05xx, STM8L15xx, STM8L162x, STM8AL31xx, STM8AL3Lxx, STM8AL31Exx and STM8AL3LExx MCU families reference manual (RM0031),  $t_{IDLE}$  defines the time between 2 conversions, or between ADC ON and the first conversion.  $t_{IDLE}$  is not relevant for this device.

In the following three tables, data are guaranteed by characterization result, not tested in production.

**Table 57. ADC1 accuracy with  $V_{DDA} = 2.5\text{ V}$  to  $3.3\text{ V}$**

| Symbol | Parameter                  | Conditions                | Typ. | Max <sup>(1)</sup> | Unit |

Figure 36. ADC1 accuracy characteristics

Figure 37. Typical connection diagram using the ADC

1. Refer to [Table 56](#) for the values of  $R_{AIN}$  and  $C_{ADC}$ .
2.  $C_{parasitic}$  represents the capacitance of the PCB (dependent on soldering and PCB layout quality) plus the pad capacitance (roughly 7 pF). A high  $C_{parasitic}$  value will downgrade conversion accuracy. To remedy this,  $f_{ADC}$  should be reduced.

**Figure 38. Maximum dynamic current consumption on  $V_{REF+}$  supply pin during ADC conversion****Table 60.  $R_{AIN}$  max for  $f_{ADC} = 16 \text{ MHz}^{(1)}$** 

| Ts<br>(cycles) | Ts<br>(µs) | $R_{AIN}$ max (kohm)                      |                                           |                                           |                                           |

1. Guaranteed by design.

### General PCB design guidelines

Power supply decoupling should be performed as shown in [Figure 39](#) or [Figure 40](#), depending on whether  $V_{REF+}$  is connected to  $V_{DDA}$  or not. Good quality ceramic 10 nF capacitors should be used. They should be placed as close as possible to the chip.

**Figure 39. Power supply and reference decoupling ( $V_{REF+}$  not connected to  $V_{DDA}$ )****Figure 40. Power supply and reference decoupling ( $V_{REF+}$  connected to  $V_{DDA}$ )**

### 9.3.15 EMC characteristics

Susceptibility tests are performed on a sample basis during product characterization.

#### Functional EMS (electromagnetic susceptibility)

Based on a simple running application on the product (toggling 2 LEDs through I/O ports), the product is stressed by two electromagnetic events until a failure occurs (indicated by the LEDs).

- **ESD:** Electrostatic discharge (positive and negative) is applied on all pins of the device until a functional disturbance occurs. This test conforms to the ANSI/ESDA/JEDEC JS-001, JESD22-A115 and ANSI/ESD S5.3.1.
- **FTB:** A burst of fast transient voltage (positive and negative) is applied to  $V_{DD}$  and  $V_{SS}$  through a 100 pF capacitor, until a functional disturbance occurs. This test conforms with the IEC 61000 standard.

A device reset allows normal operations to be resumed. The test results are given in the table below based on the EMS levels and classes defined in application note AN1709.

#### Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

#### Prequalification trials:

Most of the common failures (unexpected reset and program counter corruption) can be reproduced by manually forcing a low state on the NRST pin or the Oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring (see application note AN1015).

**Table 61. EMS data**

| Symbol     | Parameter                                                                                                                         | Conditions                                                                                          |           | Level/<br>Class |
|------------|-----------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|-----------|-----------------|
| $V_{FESD}$ | Voltage limits to be applied on any I/O pin to induce a functional disturbance                                                    | $V_{DD} = 3.3\text{ V}$ , $T_A = +25\text{ °C}$ , $f_{CPU} = 16\text{ MHz}$ , conforms to IEC 61000 |           | 3B              |
| $V_{EFTB}$ | Fast transient voltage burst limits to be applied through 100 pF on $V_{DD}$ and $V_{SS}$ pins to induce a functional disturbance | $V_{DD} = 3.3\text{ V}$ , $T_A = +25\text{ °C}$ , $f_{CPU} = 16\text{ MHz}$ , conforms to IEC 61000 | Using HSI | 4A              |
|            |                                                                                                                                   |                                                                                                     | Using HSE | 2B              |

**Electromagnetic interference (EMI)**

Based on a simple application running on the product (toggling two LEDs through the I/O ports), the product is monitored in terms of emission. This emission test is in line with the norm IEC61967-2 which specifies the board and the loading of each pin.

**Table 62. EMI data <sup>(1)</sup>**

| Symbol           | Parameter  | Conditions                                                                                    | Monitored frequency band | Max vs. | Unit |

1. Not tested in production.

**Absolute maximum ratings (electrical sensitivity)**

Based on two different tests (ESD and LU) using specific measurement methods, the product is stressed in order to determine its performance in terms of electrical sensitivity. For more details, refer to the application note AN1181.

**Electrostatic discharge (ESD)**

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts\*(n+1) supply pin). Two models can be simulated: human body model and charge device model. This test conforms to the ANSI/ESDA/JEDEC JS-001, JESD22-A115 and ANSI/ESD S5.3.1.

**Table 63. ESD absolute maximum ratings**

| Symbol                | Ratings                                               | Conditions                                                    | Class | Maximum value <sup>(1)</sup> | Unit |
|-----------------------|-------------------------------------------------------|---------------------------------------------------------------|-------|------------------------------|------|
| V <sub>ESD(HBM)</sub> | Electrostatic discharge voltage (human body model)    | T <sub>A</sub> = +25 °C, conforming to ANSI/ESDA/JEDEC JS-001 | 2     | 2000                         | V    |
| V <sub>ESD(CDM)</sub> | Electrostatic discharge voltage (charge device model) | T <sub>A</sub> = +25 °C, conforming to ANSI/ESD S5.3.1        | C4B   | 500                          |      |
| V <sub>ESD(MM)</sub>  | Electrostatic discharge voltage (Machine model)       | T <sub>A</sub> = +25 °C, conforming to JESD22-A115            | M2    | 200                          |      |

1. Guaranteed by characterization results.

**Static latch-up**

- **LU:** three complementary static tests are required on 6 parts to assess the latch-up performance. A supply overvoltage (applied to each power supply pin) and a current injection (applied to each input, output and configurable I/O pin) are performed on each sample. This test conforms to the EIA/JESD 78 IC latch-up standard. For more details, refer to the application note AN1181.

**Table 64. Electrical sensitivities**

| Symbol | Parameter             | Conditions              | Class <sup>(1)</sup> |
|--------|-----------------------|-------------------------|----------------------|
| LU     | Static latch-up class | T <sub>A</sub> = 125 °C | A                    |

1. Class description: A Class is an STMicroelectronics internal specification. All its limits are higher than the JEDEC specifications, that means when a device belongs to class A it exceeds the JEDEC standard. B class strictly covers all the JEDEC criteria (international standard).

## 10 Package information

### 10.1 ECOPACK

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK® is an ST trademark.

1. Values in inches are converted from mm and rounded to 4 decimal digits.

**Figure 42. LQFP48 - 48-pin, 7 x 7 mm low-profile quad flat recommended footprint**

1. Dimensions are expressed in millimeters.

## Device marking for LQFP48

The following figure gives an example of topside marking orientation versus pin 1 identifier location. The printed markings may differ depending on the supply chain. Other optional marking or inset/upset marks, which identify the parts throughout supply chain operations, are not indicated below.

**Figure 43. LQFP48 marking example (package top view)**

1. Parts marked as "ES" or "E" are not yet qualified and therefore not approved for use in production. ST is not responsible for any consequences resulting from such use. In no event will ST be liable for the customer using any of these engineering samples in production. ST's Quality department must be contacted prior to any decision to use these engineering samples to run a qualification activity.

### 10.3 LQFP32 package information

1. Values in inches are converted from mm and rounded to 4 decimal digits.

**Figure 45. LQFP32 - 32-pin, 7 x 7 mm low-profile quad flat recommended footprint**

1. Dimensions are expressed in millimeters.

### Device marking for LQFP32

The following figure gives an example of topside marking orientation versus pin 1 identifier location. The printed markings may differ depending on the supply chain.

Other optional marking or inset/upset marks, which identify the parts throughout supply chain operations, are not indicated below.

**Figure 46. LQFP32 marking example (package top view)**

1. Parts marked as "ES" or "E" are not yet qualified and therefore not approved for use in production. ST is not responsible for any consequences resulting from such use. In no event will ST be liable for the customer using any of these engineering samples in production. ST's Quality department must be contacted prior to any decision to use these engineering samples to run a qualification activity.

## 10.4 VFQFPN32 package information

Figure 47. VFQFPN32 - 32-pin, 5x5 mm, 0.5 mm pitch very thin profile fine pitch quad flat package outline

1. Drawing is not to scale.
2. There is an exposed die pad on the underside of the VQFPN package. It is recommended to connect and solder this backside pad to the PCB ground.

**Table 67. VFQFPN32 - 32-pin, 5x5 mm, 0.5 mm pitch very thin profile fine pitch quad flat package mechanical data**

### Device marking for VFQFPN32

The following figure gives an example of topside marking orientation versus pin 1 identifier location. The printed markings may differ depending on the supply chain.

Other optional marking or inset/upset marks, which identify the parts throughout supply chain operations, are not indicated below.

**Figure 49. VFQFPN32 marking example (package top view)**

1. Parts marked as "ES" or "E" are not yet qualified and therefore not approved for use in production. ST is not responsible for any consequences resulting from such use. In no event will ST be liable for the customer using any of these engineering samples in production. ST's Quality department must be contacted prior to any decision to use these engineering samples to run a qualification activity.

## 10.5 Thermal characteristics

The maximum chip junction temperature ( $T_{Jmax}$ ) must never exceed the values given in [Table 19: General operating conditions](#).

The maximum chip-junction temperature,  $T_{Jmax}$ , in degree Celsius, may be calculated using the following equation:

$$T_{Jmax} = T_{Amax} + (P_{Dmax} \times \Theta_{JA})$$

Where:

- $T_{Amax}$  is the maximum ambient temperature in °C
- $\Theta_{JA}$  is the package junction-to-ambient thermal resistance in °C/W
- $P_{Dmax}$  is the sum of  $P_{INTmax}$  and  $P_{I/Omax}$  ( $P_{Dmax} = P_{INTmax} + P_{I/Omax}$ )
- $P_{INTmax}$  is the product of  $I_{DD}$  and  $V_{DD}$ , expressed in Watts. This is the maximum chip internal power.
- $P_{I/Omax}$  represents the maximum power dissipation on output pins

Where:

$$P_{I/Omax} = \Sigma(V_{OL} \cdot I_{OL}) + \Sigma((V_{DD} - V_{OH}) \cdot I_{OH}),$$

taking into account the actual  $V_{OL}/I_{OL}$  and  $V_{OH}/I_{OH}$  of the I/Os at low and high level in the application.

**Table 68. Thermal characteristics<sup>(1)</sup>**

| Symbol        | Parameter                                                  | Value | Unit |
|---------------|------------------------------------------------------------|-------|------|
| $\Theta_{JA}$ | Thermal resistance junction-ambient<br>LQFP48- 7 x 7 mm    | 65    | °C/W |
|               | Thermal resistance junction-ambient<br>LQFP32 - 7 x 7 mm   | 59    |      |
|               | Thermal resistance junction-ambient<br>VFQFPN32 - 5 x 5 mm | 62    |      |

1. Thermal resistances are based on JEDEC JESD51-2 with 4-layer PCB in a natural convection environment.

# 11 Device ordering information
