Q0 connected to $\overline{C1}$.

Input Loading Factor:

R0, R9 = 1

$$\overline{C0} = 2$$
$$\overline{C1} = 4$$

Output Loading Factor = 10

Total Power Dissipation = 160 mW typ/pkg

Propagation Delay Time = 20 ns typ/bit

These 4-bit counters are comprised of a divide-by-two section and a divide-by-five section. These sections can be used independently, or can be connected to perform the counting function or the simple divide-by-ten function. Two sets of direct RESET inputs are provided to allow setting all outputs to a logic "0" or to the BCD count of 9.

SWITCHING TIME TEST CIRCUIT AND WAVEFORMS

$f_{\text{tog}} = 10 \text{ MHz min}$

$C_T = 15 \text{ pF}$ = total parasitic capacitance, which includes probe, wiring, and load capacitances.

*The coax delays from input to scope and output to scope must be matched. The scope must be terminated in 50-ohm impedance. The 950-ohm resistor and the scope termination impedance constitute a 20:1 attenuator probe.

**A load is connected to each output during the test.
