

## 1. Features

- Low-voltage and Standard-voltage Operation
  - 2.7 ( $V_{CC} = 2.7V$  to 5.5V)
  - 1.8 ( $V_{CC} = 1.8V$  to 5.5V)
- User-selectable Internal Organization
  - 2K: 256 x 8 or 128 x 16
  - 4K: 512 x 8 or 256 x 16
- Three-wire Serial Interface
- Sequential Read Operation
- 2 MHz Clock Rate (5V)
- Self-timed Write Cycle (10 ms Max)
- High Reliability
  - Endurance: 1 Million Write Cycles
  - Data Retention: 100 Years
- Automotive Devices Available
- 8-lead JEDEC PDIP, 8-lead JEDEC SOIC, 8-lead EIAJ SOIC, 8-lead Ultra Thin mini-MAP (MLP 2x3), 8-lead Ultra Lead Frame Land Grid Array (ULA), 8-lead TSSOP and 8-ball dBGAA2 Packages

## 2. Description

The AT93C56A/66A provides 2048/4096 bits of serial electrically erasable programmable read-only memory (EEPROM) organized as 128/256 words of 16 bits each (when the ORG pin is connected to VCC) and 256/512 words of 8 bits each (when the ORG pin is tied to ground). The device is optimized for use in many industrial and commercial applications where low-power and low-voltage operations are essential. The AT93C56A/66A is available in space-saving 8-lead PDIP, 8-lead JEDEC SOIC, 8-lead EIAJ SOIC, 8-lead Ultra Thin mini-MAP (MLP 2x3), 8-lead Ultra Lead Frame Land Grid Array (ULA), 8-lead TSSOP, and 8-ball dBGAA2 packages.

The AT93C56A/66A is enabled through the Chip Select pin (CS) and accessed via a three-wire serial interface consisting of Data Input (DI), Data Output (DO), and Shift Clock (SK). Upon receiving a read instruction at DI, the address is decoded and the data is clocked out serially on the data output pin DO. The write cycle is completely self-timed and no separate erase cycle is required before write. The write cycle is only enabled when the part is in the Erase/Write Enable State. When CS is brought “high” following the initiation of a write cycle, the DO pin outputs the Ready/Busy status of the part.

The AT93C56A/66A is available in 2.7V to 5.5V and 1.8V to 5.5V versions.

### Three-wire Serial EEPROM

2K (256 x 8 or 128 x 16)

4K (512 x 8 or 256 x 16)

**Table 2-1. Pin Configurations**

| Pin Name | Function              |
|----------|-----------------------|
| CS       | Chip Select           |
| SK       | Serial Data Clock     |
| DI       | Serial Data Input     |
| DO       | Serial Data Output    |
| GND      | Ground                |
| VCC      | Power Supply          |
| ORG      | Internal Organization |
| NC       | No Connect            |

### 3. Absolute Maximum Ratings\*

|                                                    |                 |
|----------------------------------------------------|-----------------|
| Operating Temperature .....                        | –55°C to +125°C |
| Storage Temperature .....                          | –65°C to +150°C |
| Voltage on Any Pin<br>with Respect to Ground ..... | –1.0V to +7.0V  |
| Maximum Operating Voltage .....                    | 6.25V           |
| DC Output Current .....                            | 5.0 mA          |

**\*NOTICE:** Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability

**Figure 3-1.** Block Diagram

**Note:** When the ORG pin is connected to VCC, the x 16 organization is selected. When it is connected to ground, the x 8 organization is selected. If the ORG pin is left unconnected and the application does not load the input beyond the capability of the internal 1 Meg ohm pullup, then the x 16 organization is selected.

**Table 3-1.** Pin Capacitance<sup>(Note:)</sup>

Applicable over recommended operating range from  $T_A = 25^\circ\text{C}$ ,  $f = 1.0\text{ MHz}$ ,  $V_{CC} = +5.0\text{V}$  (unless otherwise noted)

| Symbol    | Test Conditions                | Max | Units | Conditions            |
|-----------|--------------------------------|-----|-------|-----------------------|
| $C_{OUT}$ | Output Capacitance (DO)        | 5   | pF    | $V_{OUT} = 0\text{V}$ |
| $C_{IN}$  | Input Capacitance (CS, SK, DI) | 5   | pF    | $V_{IN} = 0\text{V}$  |

Note: 1. This parameter is characterized and is not 100% tested.

**Table 3-2.** DC Characteristics

Applicable over recommended operating range from:  $T_A = -40^\circ\text{C}$  to  $+85^\circ\text{C}$ ,  $V_{CC} = +1.8\text{V}$  to  $+5.5\text{V}$ ,  
 $V_{CC} = +1.8\text{V}$  to  $+5.5\text{V}$  (unless otherwise noted)

| WRAL        | 1  | 00      | 01XXXXXXXX  | 01XXXXXX    | $D_7 - D_0$ | $D_{15} - D_0$ | Writes all memory locations. Valid only at $V_{CC} = 5.0V \pm 10\%$ and Disable Register cleared. |
| EWDS        | 1  | 00      | 00XXXXXXXX  | 00XXXXXX    |             |                | Disables all programming instructions.                                                            |

Note: The X's in the address field represent don't care values and must be clocked.

## 4. Functional Description

The AT93C56A/66A is accessed via a simple and versatile three-wire serial communication interface. Device operation is controlled by seven instructions issued by the host processor. **A valid instruction starts with a rising edge of CS** and consists of a Start Bit (logic “1”) followed by the appropriate Op Code and the desired memory address location.

**READ (READ):** The Read (READ) instruction contains the address code for the memory location to be read. After the instruction and address are decoded, data from the selected memory location is available at the serial output pin DO. Output data changes are synchronized with the rising edges of serial clock SK. It should be noted that a dummy bit (logic “0”) precedes the 8- or 16-bit data output string. The AT93C56A/66A supports sequential read operations. The device will automatically increment the internal address pointer and clock out the next memory location as long as Chip Select (CS) is held high. In this case, the dummy bit (logic “0”) will not be clocked out between memory locations, thus allowing for a continuous stream of data to be read.

**ERASE/WRITE (EWEN):** To assure data integrity, the part automatically goes into the Erase/Write Disable (EWDS) state when power is first applied. An Erase/Write Enable (EWEN) instruction must be executed first before any programming instructions can be carried out. Please note that once in the EWEN state, programming remains enabled until an EWDS instruction is executed or  $V_{CC}$  power is removed from the part.

**ERASE (ERASE):** The Erase instruction programs all bits in the specified memory location to the logical “1” state. The self-timed erase cycle starts once the ERASE instruction and address are decoded. The DO pin outputs the Ready/Busy status of the part if CS is brought high after being kept low for a minimum of 250 ns ( $t_{CS}$ ). A logic “1” at pin DO indicates that the selected memory location has been erased, and the part is ready for another instruction.

**WRITE (WRITE):** The Write (WRITE) instruction contains the 8 or 16 bits of data to be written into the specified memory location. The self-timed programming cycle  $t_{WP}$  starts after the last bit of data is received at serial data input pin DI. The DO pin outputs the Ready/Busy status of the part if CS is brought high after being kept low for a minimum of 250 ns ( $t_{CS}$ ). A logic “0” at DO indicates that programming is still in progress. A logic “1” indicates that the memory location at the specified address has been written with the data pattern contained in the instruction and the part is ready for further instructions. **A READY/BUSY status cannot be obtained if the CS is brought high after the end of the self-timed programming cycle  $t_{WP}$ .**

**ERASE ALL (ERAL):** The Erase All (ERAL) instruction programs every bit in the memory array to the logic “1” state and is primarily used for testing purposes. The DO pin outputs the Ready/Busy status of the part if CS is brought high after being kept low for a minimum of 250 ns ( $t_{CS}$ ). The ERAL instruction is valid only at  $V_{CC} = 5.0V \pm 10\%$ .

**WRITE ALL (WRAL):** The Write All (WRAL) instruction programs all memory locations with the data patterns specified in the instruction. The DO pin outputs the Ready/Busy status of the part if CS is brought high after being kept low for a minimum of 250 ns ( $t_{CS}$ ). The WRAL instruction is valid only at  $V_{CC} = 5.0V \pm 10\%$ .

**ERASE/WRITE DISABLE (EWDS):** To protect against accidental data disturb, the Erase/Write Disable (EWDS) instruction disables all programming modes and should be executed after all programming operations. The operation of the READ instruction is independent of both the EWEN and EWDS instructions and can be executed at any time.

## 5. Timing Diagrams

**Figure 5-1.** Synchronous Data Timing

Note: 1. This is the minimum SK period.

**Table 5-1.** Organization Key for Timing Diagrams

| I/O   | AT93C56A (2K) |             | AT93C66A (4K) |          |
|-------|---------------|-------------|---------------|----------|
|       | x 8           | x 16        | x 8           | x 16     |
| $A_N$ | $A_8^{(1)}$   | $A_7^{(2)}$ | $A_8$         | $A_7$    |
| $D_N$ | $D_7$         | $D_{15}$    | $D_7$         | $D_{15}$ |

Notes: 1.  $A_8$  is a DON'T CARE value, but the extra clock is required.  
2.  $A_7$  is a DON'T CARE value, but the extra clock is required.

Notes: 1. For 2.7V devices used in the 4.5V to 5.5V range, please refer to performance values in the AC and DC characteristics table.  
2. “U” designates Green package + RoHS compliant.  
3. “H” designates Green package + RoHS compliant, with NiPdAu Lead Finish.  
4. Available in waffle pack and wafer form; order as SL788 for inkless wafer form. Bumped die available upon request. Please contact Serial EEPROM Marketing.

| L      | 0.115     | 0.130 | 0.150 | 2    |

- Notes:
1. This drawing is for general information only; refer to JEDEC Drawing MS-001, Variation BA for additional information.
  2. Dimensions A and L are measured with the package seated in JEDEC seating plane Gauge GS-3.
  3. D, D1 and E1 dimensions do not include mold Flash or protrusions. Mold Flash or protrusions shall not exceed 0.010 inch.
  4. E and eA measured with the leads constrained to be perpendicular to datum.
  5. Pointed or rounded lead tips are preferred to ease insertion.
  6. b2 and b3 maximum dimensions do not include Dambar protrusions. Dambar protrusions shall not exceed 0.010 (0.25 mm).

| b      | 0.20     | 0.25 | 0.30 | 2    |

- Notes:
1. This drawing is for general information only. Refer to JEDEC Drawing MO-229, for proper dimensions, tolerances, datums, etc.
  2. Dimension b applies to metallized terminal and is measured between 0.15 mm and 0.30 mm from the terminal tip. If the terminal has the optional radius on the other end of the terminal, the dimension should not be measured in that radius area.
  3. Soldering the large thermal pad is optional, but not recommended. No electrical connection is accomplished to the device through this pad, so if soldered it should be tied to ground

- Notes:
1. This drawing is for general information only. Refer to JEDEC Drawing MO-153, Variation AA, for proper dimensions, tolerances, datums, etc.
  2. Dimension D does not include mold Flash, protrusions or gate burrs. Mold Flash, protrusions and gate burrs shall not exceed 0.15 mm (0.006 in) per side.
  3. Dimension E1 does not include inter-lead Flash or protrusions. Inter-lead Flash and protrusions shall not exceed 0.25 mm (0.010 in) per side.
  4. Dimension b does not include Dambar protrusion. Allowable Dambar protrusion shall be 0.08 mm total in excess of the b dimension at maximum material condition. Dambar cannot be located on the lower radius of the foot. Minimum space between protrusion and adjacent lead is 0.07 mm.
  5. Dimension D and E1 to be determined at Datum Plane H.
