

FEATURES

Ultralow supply current of 1 μA maximum (ADM6326/ADM6328)

Accurate monitoring of 2.5 V, 3 V, 3.3 V, and 5 V rails

Reset thresholds available in increments from 2.2 V to 4.63 V

Glitch immunity from negative-going V_{CC} transients

2 reset output options

Push-pull $\overline{\text{RESET}}$ (ADM6326/ADM6346)

Open-drain $\overline{\text{RESET}}$ (ADM6328/ADM6348)

Minimum reset timeout of 100 ms

Operating temperature range of -40°C to $+85^{\circ}\text{C}$

3-lead SOT-23 package

APPLICATIONS

Telecommunications

Microprocessor systems

Desktop and notebook computers

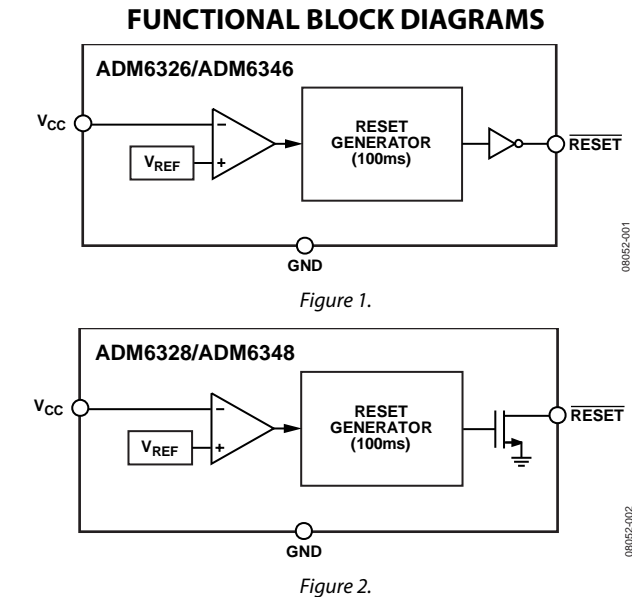

Portable equipment

GENERAL DESCRIPTION

The ADM6326/ADM6328/ADM6346/ADM6348 devices provide low cost solutions for protecting sensitive circuitry, such as microprocessor and telecommunications circuitry.

With built-in glitch immunity, ultralow supply currents, and 24 reset threshold voltage options, the ADM6326/ADM6328/ADM6346/ADM6348 not only ensure that systems are immune to fast transients on V_{CC} , but also that the devices are suitable for monitoring a variety of supply voltages in low power, portable equipment.

These devices provide a reset output during power-up, power-down, and brownout conditions. On power-up, an internal timer holds $\overline{\text{RESET}}$ asserted for at least 100 ms. This holds the

microprocessor in a reset state until conditions have stabilized. The reset output remains operational with V_{CC} as low as 1 V.

The ADM6326 and ADM6346 have an active low push-pull reset output. The ADM6328 and ADM6348 have an active low open-drain reset output, which requires an external pull-up resistor. The ADM6326 and ADM6328 offer a choice of ten reset thresholds in increments between 2.2 V and 3.08 V, whereas the ADM6346 and ADM6348 offer a choice of 14 reset thresholds between 3.3 V and 4.63 V.

These devices are available in a 3-lead SOT-23 package and operate over the extended temperature range of -40°C to $+85^{\circ}\text{C}$.

ABSOLUTE MAXIMUM RATINGS

Table 3.

| Parameter | Rating |
|---------------------------------------|-------------------------------|
| Supply Voltage, V_{CC} | -0.3 V to +6 V |
| Input Current, I_{CC} | 20 mA |
| Output Voltage | |
| Push-Pull \overline{RESET} | -0.3 V to ($V_{CC} + 0.3$ V) |
| Open-Drain \overline{RESET} | -0.3 V to +6 V |
| Output Current (\overline{RESET}) | 20 mA |
| Rate of Rise of V_{CC} | 100 V/ μ s |
| Temperature | |
| Storage | -65°C to +155°C |
| Operating | -40°C to +85°C |
| Soldering (10 sec) | 300°C |

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

THERMAL RESISTANCE

θ_{JA} is specified for the worst-case conditions, that is, a device soldered in a circuit board for surface-mount packages.

Table 4. Thermal Resistance

| Package Type | θ_{JA} | Unit |
|---------------|---------------|------|
| 3-Lead SOT-23 | 270 | °C/W |

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 3. ADM6326/ADM6328/ADM6346/ADM6348 Pin Configuration

Table 5. Pin Function Descriptions

| Pin No. | Mnemonic | Description |
|---------|----------|---|
| 1 | GND | Ground Reference for All Signals; 0 V. |
| 2 | RESET | Active Low Logic Output. This pin is low when V_{CC} is less than the reset threshold; it remains low for 185 ms (typical) after V_{CC} becomes greater than the reset threshold. |
| 3 | V_{CC} | Supply Voltage Being Monitored. |

THEORY OF OPERATION

The ADM6326/ADM6328/ADM6346/ADM6348 are designed to protect the integrity of a system's operation by ensuring the proper operation of the system during power-up, power-down, and brownout conditions. Ultralow supply currents make these devices particularly suitable for use in low power, portable equipment.

RESET OUTPUT

The ADM6326 and ADM6346 have an active low, push-pull reset output, whereas the ADM6328 and ADM6348 have an active low, open-drain reset output, which requires an external pull-up resistor. The RESET signal is guaranteed to be valid for V_{CC} down to 1 V.

When the ADM6326/ADM6328/ADM6346/ADM6348 are powered up, the RESET output remains low for a period typically equal to the RESET active timeout period of 185 ms. This feature allows adequate time for the system to power up correctly and for the power supply to stabilize before any devices are brought out of reset and are allowed to begin executing instructions. Initializing a system in this way provides a more reliable startup for microprocessor systems.

When the monitored voltage falls below its associated threshold (V_{TH}), RESET is asserted within 20 μ s (typical). Asserting RESET this quickly means that the entire system can be reset at once before any part of the system's voltage falls below its recommended operating voltage. This system reset can avoid dangerous and/or erroneous operation of a microprocessor based system.

INTERFACING TO OTHER DEVICES

The active low, open-drain reset output of the ADM6328 and ADM6348 makes these devices ideal for integration with devices such as microprocessors with bidirectional reset pins. Simply connect the RESET output of the ADM6328 or ADM6348 to the RESET input of the microprocessor using a single pull-up resistor to allow either device to initiate a system reset (see Figure 8).

Figure 8. Interfacing to a Microprocessor with a Bidirectional Reset Pin

TRANSIENT IMMUNITY

To avoid unnecessary resets caused by fast power supply transients, the ADM6326/ADM6328/ADM6346/ADM6348 provide glitch immunity from negative-going V_{CC} transients.

Figure 5 shows the RESET comparator overdrive (that is, the maximum magnitude of negative-going pulses with respect to the typical threshold) vs. the pulse duration without a reset.
