

## MAX98314

# Mono 3.2W Class D Amplifier with Integrated Input Coupling Capacitors

### General Description

The MAX98314 mono 3.2W Class D amplifier provides Class AB audio performance with Class D efficiency. This device offers five selectable gain settings (0dB, 3dB, 6dB, 9dB, and 12dB) set by a single gain-select input (GAIN).

Active emissions limiting (AEL) edge rate and overshoot control circuitry and a filterless spread-spectrum modulation (SSM) scheme greatly reduce EMI and eliminate the need for output filtering found in traditional Class D devices.

The IC's low 0.95mA at 3.7V, 1.2mA at 5.0V quiescent current extends battery life in portable applications.

Highly linear, integrated input coupling capacitors ( $C_{IN}$ ) reduce solution size and provide excellent THD+N, PSRR, and CMRR performance at low frequencies vs. standard Class D amplifiers using external input capacitors.

The IC is available in a small 9-bump, 0.3mm pitch WLP (1.0mm x 1.0mm x 0.80mm) package and is specified over the -40°C to +85°C extended temperature range.

### Applications

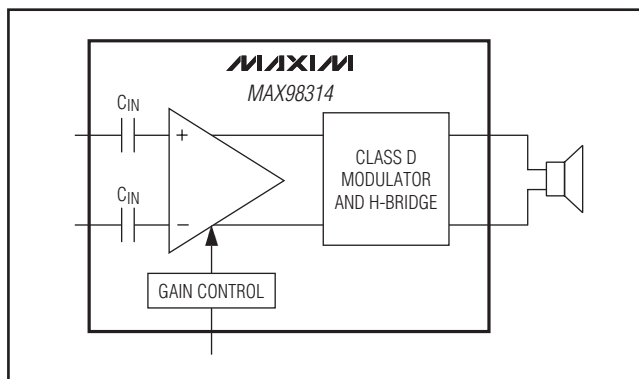

Mobile Phones  
Portable Audio  
Notebook Computers  
MP3 Players  
Netbook Computers  
VoIP Phones

**Ordering Information** appears at end of data sheet.

### Features

- ◆ **Integrated Input Coupling Capacitors with Excellent Linearity**
  - ✧  $f_C = 100\text{Hz}$  (6dB)
  - ✧  $f_C = 200\text{Hz}$  (12dB)
- ◆ **Low Quiescent Current**
  - ✧ 0.95mA at 3.7V
  - ✧ 1.2mA at 5.0V
- ◆ **Delivers High Output Power at 10% THD+N**
  - ✧ 3.2W into 4Ω,  $V_{PVDD} = 5V$
  - ✧ 960mW into 8Ω,  $V_{PVDD} = 3.7V$
- ◆ **Ultra-Low Noise: 19μV**
- ◆ **Eliminates Output Filtering Requirement**
  - ✧ Spread Spectrum and Active Emissions Limiting
- ◆ **Click-and-Pop Suppression**
- ◆ **Thermal and Overcurrent Protection**
- ◆ **Low Current Shutdown Mode**
- ◆ **Small, Space-Saving Package**

## Mono 3.2W Class D Amplifier with Integrated Input Coupling Capacitors

### Detailed Description

The MAX98314 features low quiescent current, a low-power shutdown mode, comprehensive click-and-pop suppression, and excellent RF immunity.

The IC offers Class AB audio performance with Class D efficiency in a minimal board-space solution. The Class D amplifier features spread-spectrum modulation, edge-rate, and overshoot control circuitry that offers significant improvements to switch-mode amplifier radiated emissions.

The amplifier features click-and-pop suppression that reduces audible transients on startup and shutdown. The amplifier additionally includes thermal overload and short-circuit protection.

Highly linear, integrated input coupling capacitors ( $C_{IN}$ ) reduce solution size and provide excellent THD+N, PSRR, and CMRR performance at low frequencies vs. standard Class D amplifiers using external input capacitors.

### Class D Speaker Amplifier

The IC's filterless Class D amplifier offers much higher efficiency than Class AB amplifiers. The high efficiency of a Class D amplifier is due to the switching operation of the output stage transistors. Any power loss associated with the Class D output stage is mostly due to the  $I^2R$  loss of the MOSFET on-resistance and quiescent switching current overhead.

### Ultra-Low EMI Filterless Output Stage

Traditional Class D amplifiers require the use of external LC filters, or shielding, to meet electromagnetic interference (EMI) regulation standards. Maxim's patented active emissions limiting edge-rate control circuitry and spread-spectrum modulation reduces EMI emissions, while maintaining up to 93% efficiency.

The spread-spectrum modulation mode flattens wide-band spectral components, while proprietary techniques ensure that the cycle-to-cycle variation of the switching period does not degrade audio reproduction or efficiency. The IC's spread-spectrum modulator randomly varies the switching frequency by  $\pm 20\text{kHz}$  around the center frequency (300kHz). Above 10MHz, the wideband spectrum looks like noise for EMI purposes ([Figure 1](#)).

### Amplifier Current Limit

If the output current of the speaker amplifier exceeds the current limit (2.8A typ), the IC disables the outputs for approximately 100 $\mu\text{s}$ . At the end of 100 $\mu\text{s}$ , the outputs are reenabled. If the fault condition still exists, the IC continues to disable and reenables the outputs until the fault condition is removed.

### Selectable Amplifier Gain

The IC offers five programmable gain settings, selectable by a single gain input (GAIN).

Table 1. GAIN Selection

GAIN PIN	MAXIMUM GAIN (dB)
Connect to PGND	12
Connect to PGND through 100k $\Omega$ $\pm 5\%$	9
Connect to PVDD	6
Connect to PVDD through 100k $\Omega$ $\pm 5\%$	3
Unconnected	0

### Integrated Input Coupling Capacitors ( $C_{IN}$ )

The IC integrates two 0.011 $\mu\text{F}$  input coupling capacitors,  $C_{IN}$ . The input coupling capacitors, in conjunction with the amplifier's internal input resistance ( $R_{IN}$ ), form a first-order highpass filter that removes the DC bias from the incoming signal. These capacitors allow the amplifier to bias the signal to an optimum DC level.

Figure 1. EMI Performance with 60cm of Speaker Cable, No Output Filter

## Mono 3.2W Class D Amplifier with Integrated Input Coupling Capacitors

Assuming zero source impedance, the -3dB corner frequency,  $f_{-3dB}$ , is:

$$f_{-3dB} = 1/2\pi R_{IN}C_{IN} \text{ [Hz]}$$

The 100ppm/V voltage coefficient of the integrated input coupling capacitor results in excellent low-frequency THD+N performance. Figure 2 illustrates the superior linearity of the IC's integrated input coupling capacitors compared to a similar amplifier with external 0.01μF X7R and X5R 0402 input coupling capacitors.

Figure 2. Low-Frequency THD+N Performance

### Shutdown

The IC features a low-power shutdown mode, drawing < 0.1μA (typ) of supply current. Drive  $\overline{\text{SHDN}}$  low to put the IC into shutdown.

### Click-and-Pop Suppression

The speaker amplifier features Maxim's comprehensive click-and-pop suppression. During startup, the click-and-pop suppression circuitry reduces any audible transient sources internal to the device. When entering shutdown, the differential speaker outputs ramp down to PGND quickly and simultaneously.

## Applications Information

### Filterless Class D Operation

Traditional Class D amplifiers require an output filter. The filter adds cost and size, and decreases efficiency and THD+N performance. The IC's filterless modulation scheme does not require an output filter.

Because the switching frequency of the IC is well beyond the bandwidth of most speakers, voice coil movement due to the switching frequency is very small. Use a speaker with a series inductance > 10μH. Typical 8Ω speakers exhibit series inductances in the 20μH to 100μH range.

### Speaker Amplifier Power-Supply Input (PVDD)

PVDD powers the speaker amplifier and ranges from 2.5V to 5.5V. Bypass PVDD with a 0.1μF and 10μF capacitor to PGND. Apply additional bulk capacitance at the device if long input traces between PVDD and the power source are used.

### Layout and Grounding

Proper layout and grounding are essential for optimum performance. Good grounding improves audio performance and prevents switching noise from coupling into the audio signal.

Use wide, low-resistance output traces. As the load impedance decreases, the current drawn from the device increases. At higher current, the resistance of the output traces decrease the power delivered to the load. For example, if 2W is delivered from the device output to a 4Ω load through 100mΩ of total speaker trace, 1.904W is delivered to the speaker. If power is delivered through 10mΩ of total speaker trace, 1.99W is delivered to the speaker. Wide output, supply, and ground traces also improve the power dissipation of the device.

The IC is inherently designed for excellent RF immunity. For best performance, add ground fills around all signal traces on top or bottom PCB layers.
