

# 2-channel reversible motor driver BA6259N

The BA6259N incorporates two reversible-motor drivers.

## ●Features

- 1) Two reversible-motor driver circuits are built in.
- 2) Built-in thermal shutdown circuit.
- 3) SIP10pin package.

## ●Block diagram

## ●Absolute maximum ratings (Ta = 25°C)

Parameter	Symbol	Limits	Unit
Power supply voltage	V <sub>CC1</sub>	20	V
	V <sub>CC2</sub>	25	V
Power dissipation	P <sub>d</sub>	1000* <sup>1</sup>	mW
Operating temperature	T <sub>opr</sub>	-20~+75	°C
Storage temperature	T <sub>stg</sub>	-50~+125	°C
Input voltage	V <sub>IN</sub>	-0.2~+6	V
Output current	I <sub>o</sub>	1.0* <sup>2</sup>	A

\*1 Reduced by 10 mW for each increase in Ta of 1°C over 25°C.

\*2 50ms pulse with a duty ratio of 1 / 50.

● Electrical characteristics (unless otherwise noted,  $T_a = 25^\circ\text{C}$  and  $V_{cc} = 12\text{V}$ )

Parameter	Symbol	Min.	Typ.	Max.	Unit	Conditions
Operating voltage	$V_{cc1}$	8	—	18	V	$V_{cc2} < V_{cc1}$
	$V_{cc2}$	8	—	18	V	
Output reference voltage (pin 8)	$V_R$	8	—	18	V	$V_R$ and $V_{cc2}$ are directly connected
Current dissipation	$I_{cc}$	—	12	24	mA	$R_L = \infty$ , 4, 5, 6pin ; "L"
Input low level voltage	$V_{IL}$	—	—	1.0	V	Pins 4, 5
Input high level voltage	$V_{IH}$	3.5	—	—	V	Pins 4, 5
Output low level voltage (pins 2, 3, 10)	$V_{OL}$	—	0.3	0.5	V	$I_o = 0.15\text{A}$
Output high level voltage (pins 2, 3, 10)	$V_{OH}$	11.0	11.3	—	V	Pins 8 and 9 are directly connected, $I_o = 0.15\text{A}$

## ● Input / output truth table

Input			Output		
4pin (IN)	5pin (IN)	6pin (IN)	10pin (OUT)	2pin (OUT)	3pin (OUT)
L	L	L	OPEN	OPEN	OPEN
		H			
H	L	L	H	L	OPEN
H	L	H	L	H	OPEN
L	H	L	H	OPEN	L
L	H	H	L	OPEN	H
H	H	L	L	L	L
		H			

\* HIGH level input is 3.5 V or more.

LOW level input is 1.0 V or less.

## ● Application example

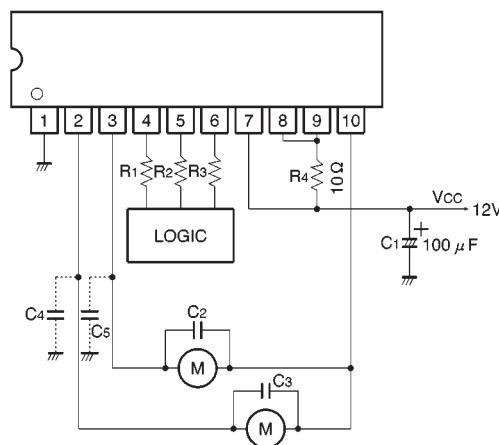

Fig.1

$C_2, C_3$  : Capacitors for preventing parasitic oscillation. Though the optimum capacitance depends on such PCB arrangement factors as the power supply circuit, motor characteristics, and conductor foil patterns, a range of  $0.01 \sim 1\mu\text{F}$  is recommended.

$C_4, C_5$  : Capacitors for preventing parasitic oscillation. They may or may not be required, depending on the PCB arrangement. A capacitance range of  $0.01 \sim 10\mu\text{F}$  is recommended.

● Control pin equivalent circuit

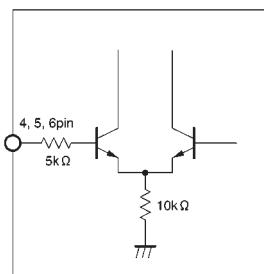

Fig.2

● Operation notes

- (1) Use the BA6259N with  $V_R$  (pin 8) short-circuited to  $V_{CC2}$  (pin 9). The  $V_{CC2}$  potential should be lower than the  $V_{CC1}$  potential. Under these conditions, the IC provides a HIGH level output voltage of 11.3V (typical,  $V_{CC2}=12V$ ). Because a single transistor is used for the low-side output stage, the LOW level output voltage is further lowered. This results in a wide range of motor drive voltage.
- (2) Though the IC input pins can be directly connected with MOS output pins, it is recommendable to connect resistors of a few kilohms to dozen of kilohms between the pins for the sake of pin protection.

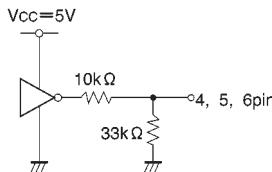

Fig.3

(3) Due to the effects of capacitors  $C_2 \sim C_5$ , the motor that is not being driven could be momentarily driven during mode switching. Check for this problem when designing your application.

(4) It is recommendable to arrange your design so that voltage rises at  $V_{CC1}$  prior to  $V_{CC2}$  when turning on the power, and voltage falls at  $V_{CC1}$  after  $V_{CC2}$  when turning off the power.

(5) Thermal shutdown circuit

When the thermal shutdown circuit is activated, the output is left OPEN. The circuit is activated when the IC junction temperature rises above 170°C. The temperature difference between the activation and deactivation settings is about 30°C.

(6) The quality of these products have been carefully checked; however, use of the products with applied voltages, operating temperatures, or other parameters that exceed the absolute maximum rating given may result in the damage of the IC and the product it is used in. If the IC is damaged, the short mode and open modes cannot be specified, so if the IC is to be used in applications where parameters may exceed the absolute maximum ratings, then be sure to incorporate fuses, or other physical safety measures.

(7) Input pins

Voltage should never be applied to the input pins when the  $V_{CC}$  voltage is not applied to the IC. Similarly, when  $V_{CC}$  is applied, the voltage on each input pin should be less than  $V_{CC}$  and within the guaranteed range for the electrical characteristics.

(8) Back-rush voltage

Depending on the ambient conditions, environment, or motor characteristics, the back-rush voltage may fluctuate. Be sure to confirm that the back-rush voltage will not adversely affect the operation of the IC.

### (9) Large current line

Large currents are carried by the motor power supply and motor ground for these ICs.

Therefore, the layout of the pattern of the PC board and the constants of certain parameters for external components, such as the capacitor between the power supply and ground, may cause this large output current to flow back to the input pins, resulting in output oscillation or other malfunctions. To prevent this, make sure that the PC board layout and external circuit constants cause no problems with the characteristics of these ICs.

### (10) Power dissipation

The power dissipation will fluctuate depending on the mounting conditions of the IC and the ambient environment. Make sure to carefully check the thermal design of the application where these ICs will be used.

### (11) Power consumption

The power consumption by the IC varies widely with the power supply voltage and the output current. Give full consideration to the power dissipation rating and the thermal resistance data and transient thermal resistance data, to provide a thermal design so that none of the ratings for the IC are exceeded.

### (12) ASO

Make sure that the output current and supply voltage do not exceed the ASO values.

### (13) Precautions for input mode switching

To ensure reliability, it is recommended that the mode switching for the motor pass once through the open mode.

### (14) In-rush current

There are no circuits built into these ICs that prevent in-rush currents. Therefore, it is recommended to place a current limiting resistor or other physical countermeasure.

### (15) Factors regarding the thermal, power supply, and motor conditions

If the potential of the output pin sways greatly and goes below the potential of ground, the operation of the IC may malfunction or be adversely affected. In such a case, place a diode between the output and ground, or other measure, to prevent this.

### Notes

- No technical content pages of this document may be reproduced in any form or transmitted by any means without prior permission of ROHM CO.,LTD.
- The contents described herein are subject to change without notice. The specifications for the product described in this document are for reference only. Upon actual use, therefore, please request that specifications to be separately delivered.
- Application circuit diagrams and circuit constants contained herein are shown as examples of standard use and operation. Please pay careful attention to the peripheral conditions when designing circuits and deciding upon circuit constants in the set.
- Any data, including, but not limited to application circuit diagrams information, described herein are intended only as illustrations of such devices and not as the specifications for such devices. ROHM CO.,LTD. disclaims any warranty that any use of such devices shall be free from infringement of any third party's intellectual property rights or other proprietary rights, and further, assumes no liability of whatsoever nature in the event of any such infringement, or arising from or connected with or related to the use of such devices.
- Upon the sale of any such devices, other than for buyer's right to use such devices itself, resell or otherwise dispose of the same, no express or implied right or license to practice or commercially exploit any intellectual property rights or other proprietary rights owned or controlled by
- ROHM CO., LTD. is granted to any such buyer.
- Products listed in this document use silicon as a basic material.

Products listed in this document are no antiradiation design.

The products listed in this document are designed to be used with ordinary electronic equipment or devices (such as audio visual equipment, office-automation equipment, communications devices, electrical appliances and electronic toys).

Should you intend to use these products with equipment or devices which require an extremely high level of reliability and the malfunction of which would directly endanger human life (such as medical instruments, transportation equipment, aerospace machinery, nuclear-reactor controllers, fuel controllers and other safety devices), please be sure to consult with our sales representative in advance.

#### About Export Control Order in Japan

Products described herein are the objects of controlled goods in Annex 1 (Item 16) of Export Trade Control Order in Japan.

In case of export from Japan, please confirm if it applies to "objective" criteria or an "informed" (by MITI clause) on the basis of "catch all controls for Non-Proliferation of Weapons of Mass Destruction.
