

LM4951 Boomer® Audio Power Amplifier Series Wide Voltage Range 1.8 Watt Audio AmplifierCheck for Samples: [LM4951](#)**FEATURES**

- Click and Pop Circuitry Eliminates Noise during Turn-On and Turn-Off Transitions
- Low Current, Active-Low Shutdown Mode
- Low Quiescent Current
- Thermal Shutdown Protection
- Unity-Gain Stable
- External Gain Configuration Capability

APPLICATIONS

- Portable Handheld Devices up to 9V
- Cell Phone
- PDA

KEY SPECIFICATIONS

- Wide Voltage Range: 2.7V to 9 V
- Quiescent Power Supply Current ($V_{DD} = 7.5V$): 2.5mA (typ)
- Power Output BTL at 7.5V, 1% THD: 1.8 W (typ)
- Shutdown Current: 0.01 μ A (typ)
- Fast Turn on Time: 25ms (typ)

DESCRIPTION

The LM4951 is an audio power amplifier primarily designed for demanding applications in Portable Handheld devices. It is capable of delivering 1.8W mono BTL to an 8 Ω load, continuous average power, with less than 1% distortion (THD+N) from a 7.5V_{DC} power supply.

Boomer audio power amplifiers were designed specifically to provide high quality output power with a minimal amount of external components. The LM4951 does not require bootstrap capacitors, or snubber circuits.

The LM4951 features a low-power consumption active-low shutdown mode. Additionally, the LM4951 features an internal thermal shutdown protection mechanism.

The LM4951 contains advanced click and pop circuitry that eliminates noises which would otherwise occur during turn-on and turn-off transitions.

The LM4951 is unity-gain stable and can be configured by external gain-setting resistors.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

Typical Application

* R_C is needed for over/under voltage protection. If inputs are less than $V_{DD} + 0.3V$ and greater than $-0.3V$, and if inputs are disabled when in shutdown mode, then R_C may be shorted.

- (1) All voltages are measured with respect to the GND pin, unless otherwise specified.
- (2) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is functional, but do not ensure specific performance limits. Electrical Characteristics state DC and AC electrical specifications under particular test conditions which ensure specific performance limits. This assumes that the device is within the Operating Ratings. Specifications are not specified for parameters where no limit is given, however, the typical value is a good indication of device performance.
- (3) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/ Distributors for availability and specifications.
- (4) The maximum power dissipation must be derated at elevated temperatures and is dictated by T_{JMAX} , θ_{JA} , and the ambient temperature, T_A . The maximum allowable power dissipation is $P_{DMAX} = (T_{JMAX} - T_A) / \theta_{JA}$ or the given in Absolute Maximum Ratings, whichever is lower. For the LM4951 typical application (shown in [Figure 1](#)) with $V_{DD} = 7.5V$, $R_L = 8\Omega$ mono-BTL operation the max power dissipation is 1.42W. $\theta_{JA} = 73^\circ C/W$.
- (5) Human body model, 100pF discharged through a 1.5k Ω resistor.
- (6) Machine Model, 220pF–240pF discharged through all pins.

APPLICATION INFORMATION

HIGH VOLTAGE BOOMER

Unlike previous 5V Boomer amplifiers, the LM4951 is designed to operate over a power supply voltages range of 2.7V to 9V. Operating on a 7.5V power supply, the LM4951 will deliver 1.8W into an 8Ω BTL load with no more than 1% THD+N.

BRIDGE CONFIGURATION EXPLANATION

As shown in [Figure 1](#), the LM4951 consists of two operational amplifiers that drive a speaker connected between their outputs. The value of input and feedback resistors determine the gain of each amplifier. External resistors R_i and R_f set the closed-loop gain of AMP_A, whereas two 20kΩ internal resistors set AMP_B's gain to -1. The LM4951 drives a load, such as a speaker, connected between the two amplifier outputs, V_{O+} and V_{O-} . [Figure 1](#) shows that AMP_A's output serves as AMP_B's input. This results in both amplifiers producing signals identical in magnitude, but 180° out of phase. Taking advantage of this phase difference, a load is placed between AMP_A and AMP_B and driven differentially (commonly referred to as "bridge mode"). This results in a differential, or BTL, gain of

$$A_{VD} = 2(R_f / R_i) \quad (1)$$

Bridge mode amplifiers are different from single-ended amplifiers that drive loads connected between a single amplifier's output and ground. For a given supply voltage, bridge mode has a distinct advantage over the single-ended configuration: its differential output doubles the voltage swing across the load. Theoretically, this produces four times the output power when compared to a single-ended amplifier under the same conditions. This increase in attainable output power assumes that the amplifier is not current limited and that the output signal is not clipped. To ensure minimum output signal clipping when choosing an amplifier's closed-loop gain, refer to the [AUDIO POWER AMPLIFIER DESIGN](#) section. Under rare conditions, with unique combinations of high power supply voltage and high closed loop gain settings, the LM4951 may exhibit low frequency oscillations.

Another advantage of the differential bridge output is no net DC voltage across the load. This is accomplished by biasing AMP1's and AMP2's outputs at half-supply. This eliminates the coupling capacitor that single supply, single-ended amplifiers require. Eliminating an output coupling capacitor in a typical single-ended configuration forces a single-supply amplifier's half-supply bias voltage across the load. This increases internal IC power dissipation and may permanently damage loads such as speakers.

POWER DISSIPATION

Power dissipation is a major concern when designing a successful bridged amplifier.

The LM4951's dissipation when driving a BTL load is given by [Equation \(2\)](#). For a 7.5V supply and a single 8Ω BTL load, the dissipation is 1.42W.

$$P_{\text{D}_{\text{MAX-MONOBTL}}} = 4(V_{\text{DD}})^2 / 2\pi^2 R_L \quad \text{Bridge Mode} \quad (2)$$

The maximum power dissipation point given by [Equation \(2\)](#) must not exceed the power dissipation given by [Equation \(3\)](#):

$$P_{\text{D}_{\text{MAX}}} = (T_{\text{J}_{\text{MAX}}} - T_A) / \theta_{\text{JA}} \quad (3)$$

The LM4951's $T_{\text{J}_{\text{MAX}}} = 150^\circ\text{C}$. In the DPR package, the LM4951's θ_{JA} is 73°C/W when the metal tab is soldered to a copper plane of at least 1in^2 . This plane can be split between the top and bottom layers of a two-sided PCB. Connect the two layers together under the tab with an array of vias. At any given ambient temperature T_A , use [Equation \(3\)](#) to find the maximum internal power dissipation supported by the IC packaging. Rearranging [Equation \(3\)](#) and substituting $P_{\text{D}_{\text{MAX}}}$ for $P_{\text{D}_{\text{MAX}}}'$ results in [Equation \(4\)](#). This equation gives the maximum ambient temperature that still allows maximum stereo power dissipation without violating the LM4951's maximum junction temperature.

$$T_A = T_{\text{J}_{\text{MAX}}} - P_{\text{D}_{\text{MAX-MONOBTL}}} \theta_{\text{JA}} \quad (4)$$

For a typical application with a 7.5V power supply and a BTL 8Ω load, the maximum ambient temperature that allows maximum stereo power dissipation without exceeding the maximum junction temperature is approximately 46°C for the TS package.

$$T_{JMAX} = P_{DMAX-MONOBTL} \theta_{JA} + T_A \quad (5)$$

Equation (5) gives the maximum junction temperature T_{JMAX} . If the result violates the LM4951's 150°C, reduce the maximum junction temperature by reducing the power supply voltage or increasing the load resistance. Further allowance should be made for increased ambient temperatures.

The above examples assume that a device is operating around the maximum power dissipation point. Since internal power dissipation is a function of output power, higher ambient temperatures are allowed as output power or duty cycle decreases.

If the result of Equation 2 is greater than that of Equation (3), then decrease the supply voltage, increase the load impedance, or reduce the ambient temperature. Further, ensure that speakers rated at a nominal 8Ω do not fall below 6Ω. If these measures are insufficient, a heat sink can be added to reduce θ_{JA} . The heat sink can be created using additional copper area around the package, with connections to the ground pins, supply pin and amplifier output pins. Refer to the [Typical Performance Characteristics](#) curves for power dissipation information at lower output power levels.

POWER SUPPLY VOLTAGE LIMITS

Continuous proper operation is ensured by never exceeding the voltage applied to any pin, with respect to ground, as listed in the [Absolute Maximum Ratings](#) section.

POWER SUPPLY BYPASSING

As with any power amplifier, proper supply bypassing is critical for low noise performance and high power supply rejection. Applications that employ a voltage regulator typically use a 10μF in parallel with a 0.1μF filter capacitors to stabilize the regulator's output, reduce noise on the supply line, and improve the supply's transient response. However, their presence does not eliminate the need for a local 1.0μF tantalum bypass capacitance connected between the LM4951's supply pins and ground. Do not substitute a ceramic capacitor for the tantalum. Doing so may cause oscillation. Keep the length of leads and traces that connect capacitors between the LM4951's power supply pin and ground as short as possible. Connecting a larger capacitor, C_{BYPASS} , between the BYPASS pin and ground improves the internal bias voltage's stability and improves the amplifier's PSRR. The PSRR improvements increase as the bypass pin capacitor value increases. Too large, however, increases turn-on time and can compromise the amplifier's click and pop performance. The selection of bypass capacitor values, especially C_{BYPASS} , depends on desired PSRR requirements, click and pop performance (as explained in the section, [SELECTING EXTERNAL COMPONENTS](#)), system cost, and size constraints.

MICRO-POWER SHUTDOWN

The LM4951 features an active-low micro-power shutdown mode. When active, the LM4951's micro-power shutdown feature turns off the amplifier's bias circuitry, reducing the supply current. The low 0.01μA typical shutdown current is achieved by applying a voltage to the SHUTDOWN pin that is as near to GND as possible. A voltage that is greater than GND may increase the shutdown current.

There are a few methods to control the micro-power shutdown. These include using a single-pole, single-throw switch (SPST), a microprocessor, or a microcontroller. When using a switch, connect the SPST switch between the shutdown pin and V_{DD} . Select normal amplifier operation by closing the switch. Opening the switch applies GND to the SHUTDOWN pin activating micro-power shutdown. The switch and internal pull-down resistor ensures that the SHUTDOWN pin will not float. This prevents unwanted state changes. In a system with a microprocessor or a microcontroller, use a digital output to apply the active-state voltage to the SHUTDOWN pin.

SELECTING EXTERNAL COMPONENTS

Input Capacitor Value Selection

Two quantities determine the value of the input coupling capacitor: the lowest audio frequency that requires amplification and desired output transient suppression.

As shown in [Figure 1](#), the input resistor (R_i) and the input capacitor (C_i) produce a high pass filter cutoff frequency that is found using [Equation 6](#).

$$f_c = 1/2\pi R_i C_i \quad (6)$$

As an example when using a speaker with a low frequency limit of 50Hz, C_i , using Equation (6) is $0.159\mu\text{F}$. The $0.39\mu\text{F}$ C_{INA} shown in Figure 1 allows the LM4951 to drive high efficiency, full range speaker whose response extends below 30Hz.

Selecting Value For R_C

The LM4951 is designed for very fast turn on time. The Cchg pin allows the input capacitors (C_{inA} and C_{inB}) to charge quickly to improve click/pop performance. Rchg1 and Rchg2 protect the Cchg pins from any over/under voltage conditions caused by excessive input signal or an active input signal when the device is in shutdown. The recommended value for Rchg1 and Rchg2 is $1\text{k}\Omega$. If the input signal is less than $V_{\text{DD}}+0.3\text{V}$ and greater than -0.3V , and if the input signal is disabled when in shutdown mode, Rchg1 and Rchg2 may be shorted out.

OPTIMIZING CLICK AND POP REDUCTION PERFORMANCE

The LM4951 contains circuitry that eliminates turn-on and shutdown transients ("clicks and pops"). For this discussion, turn-on refers to either applying the power supply voltage or when the micro-power shutdown mode is deactivated.

As the $V_{\text{DD}}/2$ voltage present at the BYPASS pin ramps to its final value, the LM4951's internal amplifiers are configured as unity gain buffers. An internal current source charges the capacitor connected between the BYPASS pin and GND in a controlled manner. Ideally, the input and outputs track the voltage applied to the BYPASS pin.

The gain of the internal amplifiers remains unity until the voltage on the bypass pin reaches $V_{\text{DD}}/2$. As soon as the voltage on the bypass pin is stable, there is a delay to prevent undesirable output transients ("click and pops"). After this delay, the device becomes fully functional.

AUDIO POWER AMPLIFIER DESIGN

Audio Amplifier Design: Driving 1.8W into an 8Ω BTL

The following are the desired operational parameters:	
Power Output	1.8W_{RMS}
Load Impedance	8Ω
Input Level	0.3V_{RMS} (max)
Input Impedance	$20\text{k}\Omega$
Bandwidth	$50\text{Hz}-20\text{kHz} \pm 0.25\text{dB}$

The design begins by specifying the minimum supply voltage necessary to obtain the specified output power. One way to find the minimum supply voltage is to use the Equation (7) curve in the Typical Performance Characteristics section. Another way, using Equation 7, is to calculate the peak output voltage necessary to achieve the desired output power for a given load impedance. To account for the amplifier's dropout voltage, two additional voltages, based on the Figure 30 in the Typical Performance Characteristics curves, must be added to the result obtained by Equation (7). The result is Equation (8).

$$V_{\text{opeak}} = \sqrt{2R_L P_O} \quad (7)$$

$$V_{\text{DD}} = V_{\text{OUTPEAK}} + V_{\text{ODTOP}} + V_{\text{ODBOT}} \quad (8)$$

The commonly used 7.5V supply voltage easily meets this. The additional voltage creates the benefit of headroom, allowing the LM4951 to produce peak output power in excess of 1.8W without clipping or other audible distortion. The choice of supply voltage must also not create a situation that violates of maximum power dissipation as explained above in the POWER DISSIPATION section. After satisfying the LM4951's power dissipation requirements, the minimum differential gain needed to achieve 1.8W dissipation in an 8Ω BTL load is found using Equation (9).

$$A_V \geq \sqrt{(P_O R_L)} / (V_{\text{IN}}) = V_{\text{orms}} / V_{\text{inrms}} \quad (9)$$

Thus, a minimum gain of 12.6 allows the LM4951's to reach full output swing and maintain low noise and THD+N performance. For this example, let $A_{V\text{-BTL}} = 13$. The amplifier's overall BTL gain is set using the input (R_i) and feedback (R_f) resistors of the first amplifier in the series BTL configuration. Additionally, $A_{V\text{-BTL}}$ is twice the gain set by the first amplifier's R_i and R_f . With the desired input impedance set at $20\text{k}\Omega$, the feedback resistor is found using Equation (10).

$$R_f / R_i = A_{V-BTL} / 2 \quad (10)$$

The value of R_f is 130k Ω (choose 191k Ω , the closest value). The nominal output power is 1.8W.

The last step in this design example is setting the amplifier's -3dB frequency bandwidth. To achieve the desired ± 0.25 dB pass band magnitude variation limit, the low frequency response must extend to at least one-fifth the lower bandwidth limit and the high frequency response must extend to at least five times the upper bandwidth limit. The gain variation for both response limits is 0.17dB, well within the ± 0.25 dB-desired limit. The results are an

$$f_L = 50\text{Hz} / 5 = 10\text{Hz} \quad (11)$$

and an

$$f_H = 20\text{kHz} \times 5 = 100\text{kHz} \quad (12)$$

As mentioned in the [SELECTING EXTERNAL COMPONENTS](#) section, R_i and C_i create a highpass filter that sets the amplifier's lower bandpass frequency limit. Find the coupling capacitor's value using [Equation \(13\)](#).

$$C_i = 1 / 2\pi R_i f_L \quad (13)$$

The result is

$$1 / (2\pi \times 20\text{k}\Omega \times 10\text{Hz}) = 0.795\mu\text{F} \quad (14)$$

Use a 0.82 μF capacitor, the closest standard value.

The product of the desired high frequency cutoff (100kHz in this example) and the differential gain A_{VD} , determines the upper passband response limit. With $A_{VD} = 7$ and $f_H = 100\text{kHz}$, the closed-loop gain bandwidth product (GBWP) is 700kHz. This is less than the LM4951's 3.5MHz GBWP. With this margin, the amplifier can be used in designs that require more differential gain while avoiding performance restricting bandwidth limitations.

RECOMMENDED PRINTED CIRCUIT BOARD LAYOUT

[Figures 6-8](#) show the recommended two-layer PC board layout that is optimized for the DPR0010A. This circuit is designed for use with an external 7.5V supply 8 Ω (min) speakers.

These circuit boards are easy to use. Apply 7.5V and ground to the board's V_{DD} and GND pads, respectively. Connect a speaker between the board's OUT_A and OUT_B outputs.

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
LM4951SD/NOPB	WSO	DPR	10	1000	177.8	12.4	4.3	4.3	1.3	8.0	12.0	Q1
LM4951SDX/NOPB	WSO	DPR	10	4500	330.0	12.4	4.3	4.3	1.3	8.0	12.0	Q1

TAPE AND REEL BOX DIMENSIONS

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
LM4951SD/NOPB	WSO	DPR	10	1000	208.0	191.0	35.0
LM4951SDX/NOPB	WSO	DPR	10	4500	367.0	367.0	35.0

4218856/B 01/2021

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

EXAMPLE BOARD LAYOUT

DPR0010A

WSN - 0.8 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:15X

SOLDER MASK DETAILS

4218856/B 01/2021

NOTES: (continued)

- This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/sluea271).

EXAMPLE STENCIL DESIGN

DPR0010A

WSN - 0.8 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL

EXPOSED PAD 11:
77% PRINTED SOLDER COVERAGE BY AREA
SCALE:20X
