NOTES

1. Tests of input to output isolation current resistance and capacitance are performed with the input terminals (diode) shorted together and the output terminals (transistor) shorted together.
2. The current transfer ratio (I_c/I_e) is the ratio of the detector collector current to the LED input current with V_{CE} at 10 volts.
3. Rise time (t_r) is the time required for the collector current to increase from 10% of its final value, to 90%.
Fall time (t_f) is the time required for the collector current to decrease from 90% of its initial value to 10%.
