Overview

The MicroSet Ultrasonic sensors automatically control lighting and other electrical loads based on the presence (or absence) of people. The sensors produce a low-intensity, inaudible sound that detects changes in acoustic waves caused by motion such as walking into a room, reaching for a telephone or turning a swivel chair. The sensors do not respond to audible sound. When motion is detected, the relay in the connected Greengate Switchpack is closed and lights are turned ON. If no motion occurs within a pre-set period of time, lights are turned OFF.

The NEMA WD7 Guide robotic method was utilized to verify coverage patterns. Manual override switch turns lights ON in case of sensor malfunction.

Operation

The revolutionary MicroSet breakthrough technology accurately ignores sources of continuous noise by self-adjusting which creates the first truly "wire and walk away" occupancy sensor. Its wide selection of interface options allows connection to virtually any Building Automation System for additional installation savings. MicroSet adaptive technology eliminates the need for adjustments and time delays.
