

## 24-Bit, 192-kHz Sampling, Enhanced Multi-Level $\Delta\Sigma$ , Stereo, Audio Digital-to-Analog Converter

Check for Samples: [PCM1789-Q1](#)

### FEATURES

- Qualified for Automotive Applications
- Enhanced Multi-Level Delta-Sigma DAC:
  - High Performance: Differential,  $f_s = 48$  kHz
  - THD+N: –94 dB
  - SNR: 113 dB
  - Dynamic Range: 113 dB
  - Sampling Rate: 8 kHz to 192 kHz
  - System Clock: 128  $f_s$ , 192  $f_s$ , 256  $f_s$ , 384  $f_s$ , 512  $f_s$ , 768  $f_s$ , 1152  $f_s$
  - Differential Voltage Output: 8 V<sub>pp</sub>
  - Analog Low-Pass Filter Included
  - 4x/8x Oversampling Digital Filter:
    - Passband Ripple:  $\pm 0.0018$  dB
    - Stop Band Attenuation: –75 dB
  - Zero Flags (16-/20-/24-Bits)
- Flexible Audio Interface:
  - I/F Format: I<sup>2</sup>S™, Left-/Right-Justified, DSP
  - Data Length: 16, 20, 24, 32 Bits
- Flexible Mode Control:
  - 3-Wire SPI™, 2-Wire I<sup>2</sup>C™-Compatible Serial Control Interface, or Hardware Control
  - Connect Up To 4 Devices on One SPI Bus
- Multi Functions via SPI or I<sup>2</sup>C I/F:
  - Audio I/F Format Select: I<sup>2</sup>S, Left-Justified, Right-Justified, DSP
  - Digital Attenuation and Soft Mute
  - Digital De-Emphasis: 32 kHz, 44.1 kHz, 48 kHz
  - Data Polarity Control
  - Power-Save Mode
- Multi Functions via Hardware Control:

- Audio I/F Format Select: I<sup>2</sup>S, Left-Justified
- Digital De-Emphasis Filter: 44.1 kHz
- Analog Mute by Clock Halt Detection
- External Reset Pin
- Power Supplies:
  - 5 V for Analog and 3.3 V for Digital
- Package: TSSOP-24
- Operating Temperature Range:
  - –40°C to +105°C

### APPLICATIONS

- AV Receivers
- Car Audio External Amplifiers
- Car Audio AVN Applications

### DESCRIPTION

The PCM1789-Q1 is a high-performance, single-chip, 24-bit, stereo, audio digital-to-analog converter (DAC) with differential outputs. The two-channel, 24-bit DAC employs an enhanced multi-level, delta-sigma ( $\Delta\Sigma$ ) modulator, and supports 8 kHz to 192 kHz sampling rates and a 16-/20-/24-/32-bit width digital audio input word on the audio interface. The audio interface of PCM1789-Q1 supports a 24-bit, DSP format in addition to I<sup>2</sup>S, left-justified, and right-justified formats.

The PCM1789-Q1 can be controlled through a three-wire, SPI-compatible or two-wire, I<sup>2</sup>C-compatible serial interface in software, which provides access to all functions including digital attenuation, soft mute, de-emphasis, and so forth. Also, hardware control mode provides two user-programmable functions through two control pins. The PCM1789-Q1 is available in a 24-pin TSSOP package.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### ORDERING INFORMATION<sup>(1)</sup>

| T <sub>A</sub> | PACKAGE       |              | ORDERABLE PART | TOP-SIDE MARKING |
|----------------|---------------|--------------|----------------|------------------|
| –40°C to 105°C | TSSOP-24 – PW | Reel of 2000 | PCM1789TPWRQ1  | PCM1789T         |

- (1) For the most current package and ordering information see the Package Option Addendum at the end of this document, or see the TI web site at [www.ti.com](http://www.ti.com).

### ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>

Over operating free-air temperature range (unless otherwise noted).

| Package temperature (IR reflow, peak)          |                                     | +260                       | °C   |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### RECOMMENDED OPERATING CONDITIONS

Over operating free-air temperature range (unless otherwise noted).

(1) In differential mode at  $V_{OUTx} \pm$  pin,  $f_{OUT} = 1\text{ kHz}$ , using Audio Precision System II, Average mode with 20-kHz LPF and 400-Hz HPF.

(2)  $f_S = 48\text{ kHz}$ :  $\text{SCKI} = 512 f_S$  (single),  $f_S = 96\text{ kHz}$ :  $\text{SCKI} = 256 f_S$  (dual),  $f_S = 192\text{ kHz}$ :  $\text{SCKI} = 128 f_S$  (quad).

(3) Allowable minimum input resistance of differential-to-single-ended converter with D-to-S gain = G is calculated as  $(1 + 2G)/(1 + G) \times 5\text{ k}$  for ac-coupled, and  $(1 + 0.9G)/(1 + G) \times 15\text{ k}$  for dc-coupled connection; refer to [Figure 38](#) and [Figure 39](#).

## ELECTRICAL CHARACTERISTICS: DAC (continued)

All specifications at  $T_A = +25^\circ\text{C}$ ,  $V_{CC1} = V_{CC2} = 5\text{ V}$ ,  $V_{DD} = 3.3\text{ V}$ ,  $f_S = 48\text{ kHz}$ ,  $\text{SCKI} = 512 f_S$ , 24-bit data, and Sampling mode = Auto, unless otherwise noted.

## PRODUCT OVERVIEW

The PCM1789-Q1 is a high-performance stereo DAC targeted for consumer audio applications such as Blu-ray Disc players and DVD players, as well as home multi-channel audio applications (such as home theater and A/V receivers). The PCM1789-Q1 consists of a two-channel DAC. The DAC output type is fixed with a differential configuration. The PCM1789-Q1 supports 16-/20-/24-/32-bit linear PCM input data in I<sup>2</sup>S and left-justified audio formats, and 24-bit linear PCM input data in right-justified and DSP formats with various sampling frequencies from 8 kHz to 192 kHz. The PCM1789-Q1 offers three modes for device control: two-wire I<sup>2</sup>C software, three-wire SPI software, and hardware.

## ANALOG OUTPUTS

The PCM1789-Q1 includes a two-channel DAC, with a pair of differential voltage outputs pins. The full-scale output voltage is  $(1.6 \times V_{CC1}) V_{PP}$  in differential output mode. A dc-coupled load is allowed in addition to an ac-coupled load, if the load resistance conforms to the specification. These balanced outputs are each capable of driving 0.8 VCC1 (4 V<sub>PP</sub>) typical into a 5-kΩ ac-coupled or 15-kΩ dc-coupled load with VCC1 = +5 V. The internal output amplifiers for VOUTL and VOUTR are biased to the dc common voltage, equal to 0.5 VCC1.

The output amplifiers include an RC continuous-time filter that helps to reduce the out-of-band noise energy present at the DAC outputs as a result of the noise shaping characteristics of the PCM1789-Q1 delta-sigma ( $\Delta\Sigma$ ) DACs. The frequency response of this filter is shown in the *Analog Filter Characteristic* (Figure 10) of the [Typical Characteristics](#). By itself, this filter is not enough to attenuate the out-of-band noise to an acceptable level for most applications. An external low-pass filter is required to provide sufficient out-of-band noise rejection. Further discussion of DAC post-filter circuits is provided in the [Application Information](#) section.

## VOLTAGE REFERENCE VCOM

The PCM1789-Q1 includes a pin for the common-mode voltage output, VCOM. This pin should be connected to the analog ground via a decoupling capacitor. This pin can also be used to bias external high-impedance circuits, if they are required.

## SYSTEM CLOCK INPUT

The PCM1789-Q1 requires an external system clock input applied at the SCKI input for DAC operation. The system clock operates at an integer multiple of the sampling frequency, or  $f_s$ . The multiples supported in DAC operation include  $128 f_s$ ,  $192 f_s$ ,  $256 f_s$ ,  $384 f_s$ ,  $512 f_s$ ,  $768 f_s$ , and  $1152 f_s$ . Details for these system clock multiples are shown in [Table 1](#). [Figure 18](#) and [Table 2](#) show the SCKI timing requirements.

**Table 1. System Clock Frequencies for Common Audio Sampling Rates**

| DEFAULT SAMPLING MODE | SAMPLING FREQUENCY, $f_s$ (kHz) | SYSTEM CLOCK FREQUENCY (MHz) |           |           |           |           |           |            |

## SAMPLING MODE

The PCM1789-Q1 supports three sampling modes (single rate, dual rate, and quad rate) in DAC operation. In single rate mode, the DAC operates at an oversampling frequency of  $\times 128$  (except when  $SCKI = 128 f_s$  and  $192 f_s$ ); this mode is supported for sampling frequencies less than 50 kHz. In dual rate mode, the DAC operates at an oversampling frequency of  $\times 64$ ; this mode is supported for sampling frequencies less than 100 kHz. In quad rate mode, the DAC operates at an oversampling frequency of  $\times 32$ . The sampling mode is automatically selected according to the ratio of system clock frequency and sampling frequency by default (that is, single rate for  $512 f_s$ ,  $768 f_s$ , and  $1152 f_s$ ; dual rate for  $256 f_s$  and  $384 f_s$ ; and quad rate for  $128 f_s$  and  $192 f_s$ ), but manual selection is also possible for specified combinations through the serial mode control register.

Table 3 and Figure 19 show the relationship among the oversampling rate (OSR) of the digital filter and  $\Delta\Sigma$  modulator, the noise-free shaped bandwidth, and each sampling mode setting.

**Table 3. Digital Filter OSR, Modulator OSR, and Noise-Free Shaped Bandwidth for Each Sampling Mode**

| SAMPLING<br>MODE<br>REGISTER<br>SETTING | SYSTEM CLOCK<br>FREQUENCY<br>( $\times f_s$ ) | NOISE-FREE SHAPED BANDWIDTH <sup>(1)</sup><br>(kHz) |                |                 | DIGITAL FILTER<br>OSR | MODULATOR<br>OSR |

## RESET OPERATION

The PCM1789-Q1 has both an internal power-on reset circuit and an external reset circuit. The sequences for both reset circuits are shown in [Figure 20](#) and [Figure 21](#). [Figure 20](#) illustrates the timing at the internal power-on reset. Initialization is triggered automatically at the point where VDD exceeds 2.2 V typical, and the internal reset is released after 3846 SCKI clock cycles from power-on, if RST is held high and SCKI is provided. VOUTx from the DAC is forced to the VCOM level initially (that is,  $0.5 \times VCC1$ ) and settles at a specified level according to the rising VCC. If synchronization among SCKI, BCK, and LRCK is maintained, VOUT provides an output that corresponds to DIN after 3846 SCKI clocks from power-on. If the synchronization is not held, the internal reset is not released, and both operating modes are maintained at reset and power-down states. After synchronization forms again, the DAC returns to normal operation with the previous sequences.

[Figure 21](#) illustrates a timing diagram at the external reset. RST accepts an externally-forced reset with RST low, and provides a device reset and power-down state that achieves the lowest power dissipation state available in the PCM1789-Q1. If RST goes from high to low under synchronization among SCKI, BCK, and LRCK, the internal reset is asserted, all registers and memory are reset, and finally, the PCM1789-Q1 enters into all power-down states. At the same time, VOUT is immediately forced into the AGND1 level. To begin normal operation again, toggle RST high; the same power-up sequence is performed as the power-on reset shown in [Figure 20](#).

The PCM1789-Q1 does not require particular power-on sequences for VCC and VDD; it allows VDD on and then VCC on, or VCC on and then VDD on. From the viewpoint of the [Absolute Maximum Ratings](#), however, simultaneous power-on is recommended for avoiding unexpected responses on VOUTx. [Figure 20](#) illustrates the response for VCC on with VDD on.

**Figure 20. Power-On-Reset Timing Requirements**

**Figure 21. External Reset Timing Requirements**

## AUDIO SERIAL PORT OPERATION

The PCM1789-Q1 audio serial port consists of three signals: BCK, LRCK, and DIN. BCK is a bit clock input. LRCK is a left/right word clock or frame synchronization clock input. DIN is the audio data input for VOUTL/R.

## AUDIO DATA INTERFACE FORMATS AND TIMING

The PCM1789-Q1 supports six audio data interface formats: 16-/20-/24-/32-bit I<sup>2</sup>S, 16-/20-/24-/32-bit left-justified, 24-bit right-justified, 16-bit right-justified, 24-bit left-justified mode DSP, and 24-bit I<sup>2</sup>S mode DSP. In the case of I<sup>2</sup>S, left-justified, and right-justified data formats, 64 BCKs, 48 BCKs, and 32 BCKs per LRCK period are supported; however, 48 BCKs are limited to 192/384/768 f<sub>S</sub> SCKI, and 32 BCKs are limited to 16-bit right-justified only. The audio data formats are selected by MC/SCL/FMT in hardware control mode and by the FMTDA[2:0] bits in control register 17 (11h) in software control mode. All data must be in binary two's complement and MSB first.

Table 4 summarizes the applicable formats and describes the relationships among them and the respective restrictions with mode control. Figure 22 through Figure 26 show six audio interface data formats.

**Table 4. Audio Data Interface Formats and Sampling Rate, Bit Clock, and System Clock Restrictions**

| CONTROL MODE     | FORMAT                              | DATA BITS                  | MAX LRCK FREQUENCY (f <sub>S</sub> ) | SCKI RATE (xf <sub>S</sub> ) | BCK RATE (xf <sub>S</sub> )        |
|------------------|-------------------------------------|----------------------------|--------------------------------------|------------------------------|------------------------------------|
| Software control | I <sup>2</sup> S/Left-Justified     | 16/20/24/32 <sup>(1)</sup> | 192 kHz                              | 128 to 1152 <sup>(2)</sup>   | 64, 48                             |
|                  | Right-Justified                     | 24, 16                     | 192 kHz                              | 128 to 1152 <sup>(2)</sup>   | 64, 48, 32 (16 bit) <sup>(3)</sup> |
|                  | I <sup>2</sup> S/Left-Justified DSP | 24                         | 192 kHz                              | 128 to 768                   | 64                                 |
| Hardware control | I <sup>2</sup> S/Left-Justified     | 16/20/24/32 <sup>(1)</sup> | 192 kHz                              | 128 to 1152 <sup>(2)</sup>   | 64, 48                             |

(1) 32-bit data length is acceptable only for BCK = 64 f<sub>S</sub> and when using I<sup>2</sup>S or Left-Justified format.

(2) 1152 f<sub>S</sub> is acceptable only for f<sub>S</sub> = 32 kHz, BCK = 64 f<sub>S</sub>, and when using I<sup>2</sup>S, Left-Justified, or 24-bit Right-Justified format.

(3) BCK = 32 f<sub>S</sub> is supported only for 16-bit data length.

## AUDIO INTERFACE TIMING

Figure 27 and Table 5 describe the detailed audio interface timing specifications.

**Figure 27. Audio Interface Timing Diagram for Left-Justified, Right-Justified, I<sup>2</sup>S, and DSP Data Formats**

**Table 5. Timing Requirements for Figure 27**

| SYMBOL    | DESCRIPTION                                                 | MIN                | TYP | MAX                | UNIT |
|-----------|-------------------------------------------------------------|--------------------|-----|--------------------|------|
| $t_{BCY}$ | BCK cycle time                                              | 75                 |     |                    | ns   |
| $t_{BCH}$ | BCK pulse width high                                        | 35                 |     |                    | ns   |
| $t_{BCL}$ | BCK pulse width low                                         | 35                 |     |                    | ns   |
| $t_{LRW}$ | LRCK pulse width high (LJ, RJ and I <sup>2</sup> S formats) | $1/(2 \times f_S)$ |     | $1/(2 \times f_S)$ | sec  |
|           | LRCK pulse width high (DSP format)                          | $t_{BCY}$          |     | $t_{BCY}$          | sec  |
| $t_{LRS}$ | LRCK setup time to BCK rising edge                          | 10                 |     |                    | ns   |
| $t_{LRH}$ | LRCK hold time to BCK rising edge                           | 10                 |     |                    | ns   |
| $t_{DIS}$ | DIN setup time to BCK rising edge                           | 10                 |     |                    | ns   |
| $t_{DIH}$ | DIN hold time to BCK rising edge                            | 10                 |     |                    | ns   |

## SYNCHRONIZATION WITH THE DIGITAL AUDIO SYSTEM

The PCM1789-Q1 operates under the system clock (SCKI) and the audio sampling rate (LRCK). Therefore, SCKI and LRCK must have a specific relationship. The PCM1789-Q1 does not need a specific phase relationship between the audio interface clocks (LRCK, BCK) and the system clock (SCKI), but does require a specific frequency relationship (ratiometric) between LRCK, BCK, and SCKI.

If the relationship between SCKI and LRCK changes more than  $\pm 2$  BCK clocks because of jitter, sampling frequency change, etc., the DAC internal operation stops within  $1/f_s$ , and the analog output is forced into VCOM ( $0.5 V_{CC1}$ ) until re-synchronization among SCKI, LRCK, and BCK completes, and then either  $38/f_s$  (single, dual rate) or  $29/f_s$  (quad rate) passes. In the event the change is less than  $\pm 2$  BCKs, re-synchronization does not occur, and this analog output control and discontinuity does not occur.

Figure 28 shows the DAC analog output during loss of synchronization. During undefined data periods, some noise may be generated in the audio signal. Also, the transition of normal to undefined data and undefined (or zero) data to normal data creates a discontinuity of data on the analog outputs, which may then generate some noise in the audio signal.

The DAC outputs (VOUTx) hold the previous state if the system clock halts, but the asynchronous and re-synchronization processes will occur after the system clock resumes.

**Figure 28. DAC Outputs During Loss of Synchronization**

## ZERO FLAG

The PCM1789-Q1 has two ZERO flag pins (ZERO1 and ZERO2) that can be assigned to the combinations shown in Table 6. Zero flag combinations are selected through the AZRO bit in control register 22 (16h). If the input data of all the assigned channels remain at '0' for 1024 sampling periods (LRCK clock periods), the ZERO1/2 bits are set to a high level, logic '1' state. Furthermore, if the input data of any of the assigned channels read '1', the ZERO1/2 are set to a low level, logic '0' state, immediately. Zero data detection is supported for 16-/20-/24-bit data width, but is not supported for 32-bit data width.

The active polarity of the zero flag output can be inverted through the ZREV bit in control register 22 (16h). The reset default is active high for zero detection.

In parallel hardware control mode, ZERO1 and ZERO2 are fixed with combination A, shown in Table 6.

**Table 6. Zero Flag Outputs Combination**

| ZERO FLAG COMBINATION | ZERO1                         | ZERO2                          |
|-----------------------|-------------------------------|--------------------------------|
| A                     | Left channel                  | Right channel                  |
| B                     | Left channel or right channel | Left channel and right channel |

Note that the ZERO2 pin is multiplexed with AMUTEO pin. Selection of ZERO2 or AMUTEO can be changed through the MZSEL bit in control register 22 (16h). The default setting after reset is the selection of ZERO2.

## AMUTE CONTROL

The PCM1789-Q1 has an AMUTE control input, status output pins, and functionality. AMUTEI is the input control pin of the internal analog mute circuit. An AMUTEI low input causes the DAC output to cut-off from the digital input and forces it to the center level (0.5 VCC1). AMUTE0 is the status output pin of the internal analog mute circuit. AMUTE0 low indicates the analog mute control circuit is active because of a programmed condition (such as an SCKI halt, asynchronous detect, zero detect, or by the DAC disable command) that forces the DAC outputs to a center level. Because AMUTEI is not terminated internally and AMUTE0 is an open-drain output, pull-ups by the appropriate resistors are required for proper operation.

Note that the AMUTE0 pin is multiplexed with the ZERO2 pin. The desired pin is selected through the MZSEL bit in control register 22 (16h). The default setting is the selection of the ZERO2 pin.

Additionally, because the AMUTEI pin control and power-down control in register (OPEDA when high, PSMDA when low) do not function together, AMUTEI takes priority over power-down control. Therefore, power-down control is ignored during AMUTEI low, and AMUTEI low forces the DAC output to a center level (0.5 VCC1) even if power-down control is asserted.

## MODE CONTROL

The PCM1789-Q1 includes three mode control interfaces with three oversampling configurations, depending on the input state of the MODE pin, as shown in [Table 7](#). The pull-up and pull-down resistors must be 220 kΩ ±5%.

**Table 7. Interface Mode Control Selection**

| MODE                       | MODE CONTROL INTERFACE                                                             |
|----------------------------|------------------------------------------------------------------------------------|
| Tied to DGND               | Two-wire (I <sup>2</sup> C) serial control, selectable oversampling configuration  |
| Pull-down resistor to DGND | Two-wire parallel control, auto mode oversampling configuration                    |
| Pull-up resistor to VDD    | Three-wire (SPI) serial control, selectable oversampling configuration, ADR6 = '0' |
| Tied to VDD                | Three-wire (SPI) serial control, selectable oversampling configuration, ADR6 = '1' |

The input state of the MODE pin is sampled at the moment of power-on, or during a low-to-high transition of the RST pin, with the system clock input. Therefore, input changes after reset are ignored until the next power-on or reset. From the mode control selection described in [Table 7](#), the functions of four pins are changed, as shown in [Table 8](#).

**Table 8. Pin Functions for Interface Mode**

| PIN | PIN ASSIGNMENTS |                    |                  |
|-----|-----------------|--------------------|------------------|
|     | SPI             | I <sup>2</sup> C   | H/W              |
| 21  | MD (input)      | SDA (input/output) | DEMP (input)     |
| 22  | MC (input)      | SCL (input)        | FMT (input)      |
| 23  | MS (input)      | ADR0 (input)       | RSV (input, low) |
| 24  | ADR5 (input)    | ADR1 (input)       | RSV (input, low) |

In serial mode control, the actual mode control is performed by register writes (and reads) through the SPI- or I<sup>2</sup>C-compatible serial control port. In parallel mode control, two specific functions are controlled directly through the high/low control of two specific pins, as described in the following section.

## PARALLEL HARDWARE CONTROL

The functions shown in [Table 9](#) and [Table 10](#) are controlled by two pins, DEMP and FMT, in parallel hardware control mode. The DEMP pin controls the 44.1-kHz digital de-emphasis function of both channels. The FMT pin controls the audio interface format for both channels.

**Table 9. DEMP Functionality**

| DEMP | DESCRIPTION             |
|------|-------------------------|
| Low  | De-emphasis off         |
| High | 44.1 kHz de-emphasis on |

**Table 10. FMT Functionality**

| FMT  | DESCRIPTION                                |
|------|--------------------------------------------|
| Low  | 16-/20-/24-/32-bit I <sup>2</sup> S format |
| High | 16-/20-/24-/32-bit left-justified format   |

### THREE-WIRE (SPI) SERIAL CONTROL

The PCM1789-Q1 includes an SPI-compatible serial port that operates asynchronously with the audio serial interface. The control interface consists of MD/SDA/DEMP, MC/SCL/FMT, and MS/ADR0/RSV. MD is the serial data input used to program the mode control registers. MC is the serial bit clock that shifts the data into the control port. MS is the select input used to enable the mode control port.

### CONTROL DATA WORD FORMAT

All single write operations via the serial control port use 16-bit data words. Figure 29 shows the control data word format. The first bit (fixed at '0') is for write operation. After the first bit are seven other bits, labeled ADR[6:0], that set the register address for the write operation. ADR6 is determined by the status of the MODE pin. ADR5 is determined by the state of the ADR5/ADR1/RSV pin. A maximum of four PCM1789-Q1s can be connected on the same bus at any one time. Each PCM1789-Q1 responds when receiving its own register address. The eight least significant bits (LSBs), D[7:0] on MD, contain the data to be written to the register address specified by ADR[6:0].

**Figure 29. Control Data Word Format for MD**

### REGISTER WRITE OPERATION

Figure 30 shows the functional timing diagram for single write operations on the serial control port. MS is held at a high state until a register is to be written to. To start the register write cycle, MS is set to a low state. 16 clocks are then provided on MC, corresponding to the 16 bits of the control data word on MD. After the 16th clock cycle has been completed, MS is set high to latch the data into the indexed mode control register.

In addition to single write operations, the PCM1789-Q1 also supports multiple write operations, which can be performed by sending the N-bytes (where  $N \leq 9$ ) of the 8-bit register data that follow after the first 16-bit register address and register data, while keeping the MC clocks and MS at a low state. Ending a multiple write operation can be accomplished by setting MS to a high state.

(1) X = don't care.

**Figure 30. Register Write Operation**

## TIMING REQUIREMENTS

Figure 31 shows a detailed timing diagram for the three-wire serial control interface. These timing parameters are critical for proper control port operation.

Figure 31. Three-Wire Serial Control Interface Timing

Table 11. Timing Requirements for Figure 31

| SYMBOL    | PARAMETER                                  | MIN       | MAX | UNIT |
|-----------|--------------------------------------------|-----------|-----|------|
| $t_{MCY}$ | MC pulse cycle time                        | 100       |     | ns   |
| $t_{MCL}$ | MC low-level time                          | 40        |     | ns   |
| $t_{MCH}$ | MC high-level time                         | 40        |     | ns   |
| $t_{MHH}$ | MS high-level time                         | $t_{MCY}$ |     | ns   |
| $t_{MSS}$ | MS falling edge to MC rising edge          | 30        |     | ns   |
| $t_{MSH}$ | MS rising edge from MC rising edge for LSB | 15        |     | ns   |
| $t_{MDH}$ | MD hold time                               | 15        |     | ns   |
| $t_{MDS}$ | MD setup time                              | 15        |     | ns   |

## TWO-WIRE (I<sup>2</sup>C) SERIAL CONTROL

The PCM1789-Q1 supports an I<sup>2</sup>C-compatible serial bus and data transmission protocol for fast mode configured as a slave device. This protocol is explained in the I<sup>2</sup>C specification 2.0.

The PCM1789-Q1 has a 7-bit slave address, as shown in Figure 32. The first five bits are the most significant bits (MSBs) of the slave address and are factory-preset to '10011'. The next two bits of the address byte are selectable bits that can be set by MS/ADR0/RSV and ADR5/ADR1/RSV. A maximum of four PCM1789-Q1s can be connected on the same bus at any one time. Each PCM1789-Q1 responds when it receives its own slave address.

Figure 32. Slave Address

## PACKET PROTOCOL

A master device must control the packet protocol, which consists of a start condition, a slave address with the read/write bit, data if a write operation is required, an acknowledgment if a read operation is required, and a stop condition. The PCM1789-Q1 supports both slave receiver and transmitter functions. Details about DATA for both write and read operations are described in [Figure 33](#).

- (1)  $\overline{R/W}$ : Read operation if '1'; write operation otherwise.  
 (2) ACK: Acknowledgment of a byte if '0', not Acknowledgment of a byte if '1'.  
 (3) DATA: Eight bits (byte); details are described in the [Write Operation](#) and [Read Operation](#) sections.

**Figure 33. I²C Packet Control Protocol**

## WRITE OPERATION

The PCM1789-Q1 supports a receiver function. A master device can write to any PCM1789-Q1 register using single or multiple accesses. The master sends a PCM1789-Q1 slave address with a write bit, a register address, and the data. If multiple access is required, the address is that of the starting register, followed by the data to be transferred. When valid data are received, the index register automatically increments by one. When the register address reaches &h4F, the next value is &h40. When undefined registers are accessed, the PCM1789-Q1 does not send an acknowledgment. [Figure 34](#) illustrates a diagram of the write operation. The register address and write data are in 8-bit, MSB-first format.

|             |    |               |                |     |             |     |              |     |              |     |     |    |
|-------------|----|---------------|----------------|-----|-------------|-----|--------------|-----|--------------|-----|-----|----|
| Transmitter | M  | M             | M              | S   | M           | S   | M            | S   | M            | S   | S   | M  |
| Data Type   | St | Slave Address | $\overline{W}$ | ACK | Reg Address | ACK | Write Data 1 | ACK | Write Data 2 | ACK | ACK | Sp |

NOTE: M = Master device, S = Slave device, St = Start condition,  $\overline{W}$  = Write, ACK = Acknowledge, and Sp = Stop condition.

**Figure 34. Framework for Write Operation**

## READ OPERATION

A master device can read the registers of the PCM1789-Q1. The value of the register address is stored in an indirect index register in advance. The master sends the PCM1789-Q1 slave address with a read bit after storing the register address. Then the PCM1789-Q1 transfers the data that the index register points to. [Figure 35](#) shows a diagram of the read operation.

|             |    |               |                |     |             |     |    |                              |   |     |           |      |    |
|-------------|----|---------------|----------------|-----|-------------|-----|----|------------------------------|---|-----|-----------|------|----|
| Transmitter | M  | M             | M              | S   | M           | S   | M  | M                            | M | S   | S         | M    | M  |
| Data Type   | St | Slave Address | $\overline{W}$ | ACK | Reg Address | ACK | Sr | Slave Address <sup>(1)</sup> | R | ACK | Read Data | NACK | Sp |

- (1) The slave address after the repeated start condition must be the same as the previous slave address.

NOTE: M = Master device, S = Slave device, St = Start condition, Sr = Repeated start condition,  $\overline{W}$  = Write, R = Read, ACK = Acknowledge, NACK = Not acknowledge, and Sp = Stop condition.

**Figure 35. Framework for Read Operation**

## TIMING REQUIREMENTS: SCL AND SDA

A detailed timing diagram for SCL and SDA is shown in [Figure 36](#).

**Figure 36. SCL and SDA Control Interface Timing**

**Table 12. Timing Requirements for [Figure 36](#)**

| SYMBOL      | PARAMETER                                                                   | STANDARD MODE       |      | FAST MODE            |     | UNIT    |
|-------------|-----------------------------------------------------------------------------|---------------------|------|----------------------|-----|---------|
|             |                                                                             | MIN                 | MAX  | MIN                  | MAX |         |
| $f_{SCL}$   | SCL clock frequency                                                         |                     | 100  |                      | 400 | kHz     |
| $t_{BUF}$   | Bus free time between STOP and START condition                              | 4.7                 |      | 1.3                  |     | $\mu s$ |
| $t_{LOW}$   | Low period of the SCL clock                                                 | 4.7                 |      | 1.3                  |     | $\mu s$ |
| $t_{HI}$    | High period of the SCL clock                                                | 4.0                 |      | 0.6                  |     | $\mu s$ |
| $t_{S-SU}$  | Setup time for START/Repeated START condition                               | 4.7                 |      | 0.6                  |     | $\mu s$ |
| $t_{S-HD}$  | Hold time for START/Repeated START condition                                | 4.0                 |      | 0.6                  |     | $\mu s$ |
| $t_{D-SU}$  | Data setup time                                                             | 250                 |      | 100                  |     | ns      |
| $t_{D-HD}$  | Data hold time                                                              | 0                   | 3450 | 0                    | 900 | ns      |
| $t_{SCL-R}$ | Rise time of SCL signal                                                     |                     | 1000 | $20 + 0.1 C_B$       | 300 | ns      |
| $t_{SCL-F}$ | Fall time of SCL signal                                                     |                     | 1000 | $20 + 0.1 C_B$       | 300 | ns      |
| $t_{SDA-R}$ | Rise time of SDA signal                                                     |                     | 1000 | $20 + 0.1 C_B$       | 300 | ns      |
| $t_{SDA-F}$ | Fall time of SDA signal                                                     |                     | 1000 | $20 + 0.1 C_B$       | 300 | ns      |
| $t_{P-SU}$  | Setup time for STOP condition                                               | 4.0                 |      | 0.6                  |     | $\mu s$ |
| $t_{GW}$    | Allowable glitch width                                                      |                     | N/A  |                      | 50  | ns      |
| $C_B$       | Capacitive load for SDA and SCL line                                        |                     | 400  |                      | 100 | pF      |
| $V_{NH}$    | Noise margin at high level for each connected device (including hysteresis) | $0.2 \times V_{DD}$ |      | $0.2 \times V_{DD}$  |     | V       |
| $V_{NL}$    | Noise margin at low level for each connected device (including hysteresis)  | $0.1 \times V_{DD}$ |      | $0.1 \times V_{DD}$  |     | V       |
| $V_{HYS}$   | Hysteresis of Schmitt trigger input                                         | N/A                 |      | $0.05 \times V_{DD}$ |     | V       |

## CONTROL REGISTER DEFINITIONS (SOFTWARE MODE ONLY)

The PCM1789-Q1 has many user-programmable functions that are accessed via control registers, and are programmed through the SPI or I<sup>2</sup>C serial control port. [Table 13](#) shows the available mode control functions along with reset default conditions and associated register addresses. [Table 14](#) lists the register map.

**Table 13. User-Programmable Mode Control Functions**

| FUNCTION                             | RESET DEFAULT                               | REGISTER <sup>(1)</sup> | LABEL      |
|--------------------------------------|---------------------------------------------|-------------------------|------------|
| Mode control register reset          | Normal operation                            | 16                      | MRST       |
| System reset                         | Normal operation                            | 16                      | SRST       |
| Analog mute function control         | Mute disabled                               | 16                      | AMUTE[3:0] |
| Sampling mode selection              | Auto                                        | 16                      | SRDA[1:0]  |
| Power-save mode selection            | Power save                                  | 17                      | PSMDA      |
| Audio interface format selection     | I <sup>2</sup> S                            | 17                      | FMTDA[2:0] |
| Operation control                    | Normal operation                            | 18                      | OPEDA      |
| Digital filter roll-off control      | Sharp roll-off                              | 18                      | FLT        |
| Output phase selection               | Normal                                      | 19                      | REVDA[2:1] |
| Soft mute control                    | Mute disabled                               | 20                      | MUTDA[2:1] |
| Zero flag                            | Not detected                                | 21                      | ZERO[2:1]  |
| Digital attenuation mode             | 0 dB to –63 dB, 0.5-dB step                 | 22                      | DAMS       |
| Digital de-emphasis function control | Disabled                                    | 22                      | DEMP[1:0]  |
| AMUTEO/ZERO flag selection           | ZERO2                                       | 22                      | MZSEL      |
| Zero flag function selection         | ZERO1: left-channel<br>ZERO2: right-channel | 22                      | AZRO       |
| Zero flag polarity selection         | High for detection                          | 22                      | ZREV       |
| Digital attenuation level setting    | 0 dB, no attenuation                        | 24, 25                  | ATDAX[7:0] |

- (1) If ADR6 or ADR5 is high, the register address must be changed to the number shown + offset; offset is 32, 64 and 96 according to state of ADR6, 5 (01, 10 and 11).

**Table 14. Register Map**

| ADR[6:0] <sup>(1)</sup> |     | DATA[7:0]          |                    |                    |                    |                    |                    |                    |                    |
|-------------------------|-----|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|
| DEC                     | HEX | B7                 | B6                 | B5                 | B4                 | B3                 | B2                 | B1                 | B0                 |

- (1) If ADR6 or ADR5 is high, the register address must be changed to the number shown + offset; offset is 32, 64 and 96 according to state of ADR6, 5 (01, 10 and 11).  
(2) RSV must be set to '0'.

## REGISTER DEFINITIONS

| DEC | HEX | B7   | B6   | B5     | B4     | B3     | B2     | B1    | B0    |
|-----|-----|------|------|--------|--------|--------|--------|-------|-------|
| 16  | 10  | MRST | SRST | AMUTE3 | AMUTE2 | AMUTE1 | AMUTE0 | SRDA1 | SRDA0 |

### MRST Mode control register reset

This bit sets the mode control register reset to the default value. Pop noise may be generated. Returning the MRST bit to '1' is unnecessary because it is automatically set to '1' after the mode control register is reset.

Default value = 1.

#### MRST Mode control register reset

|   |                            |
|---|----------------------------|
| 0 | Set default value          |
| 1 | Normal operation (default) |

### SRST System reset

This bit controls the system reset, which includes the resynchronization between the system clock and sampling clock, and DAC operation restart. The mode control register is not reset and the PCM1789-Q1 does not go into a power-down state. Returning the SRST bit to '1' is unnecessary; it is automatically set to '1' after triggering a system reset.

Default value = 1.

#### SRST System reset

|   |                            |
|---|----------------------------|
| 0 | Resynchronization          |
| 1 | Normal operation (default) |

### AMUTE[3:0] Analog mute function control

These bits control the enabling/disabling of each source event that triggers the analog mute control circuit.

Default value = 0000.

#### AMUTE Analog mute function control

|      |                                                       |
|------|-------------------------------------------------------|
| xxx0 | Disable analog mute control by SCKI halt              |
| xxx1 | Enable analog mute control by SCKI halt               |
| xx0x | Disable analog mute control by asynchronous detect    |
| xx1x | Enable analog mute control by asynchronous detect     |
| x0xx | Disable analog mute control by ZERO1 and ZERO2 detect |
| x1xx | Enable analog mute control by ZERO1 and ZERO2 detect  |
| 0xxx | Disable analog mute control by DAC disable command    |
| 1xxx | Enable analog mute control by DAC disable command     |

**SRDA[1:0] Sampling mode selection**

These bits control the sampling mode of DAC operation. In Auto mode, the sampling mode is automatically set according to multiples between the system clock and sampling clock: single rate for  $512 f_s$ ,  $768 f_s$ , and  $1152 f_s$ , dual rate for  $256 f_s$  or  $384 f_s$ , and quad rate for  $128 f_s$  and  $192 f_s$ .

Default value = 00.

**SRDA Sampling mode selection**

|    |                |
|----|----------------|
| 00 | Auto (default) |
| 01 | Single rate    |
| 10 | Dual rate      |
| 11 | Quad rate      |

| DEC | HEX | B7    | B6  | B5  | B4  | B3  | B2     | B1     | B0     |
|-----|-----|-------|-----|-----|-----|-----|--------|--------|--------|
| 17  | 11  | PSMDA | RSV | RSV | RSV | RSV | FMTDA2 | FMTDA1 | FMTDA0 |

**PSMDA Power-save mode selection**

This bit selects the power-save mode for the OPEDA function. When PSMDA = 0, OPEDA controls the power-save mode and normal operation. When PSMDA = 1, OPEDA functions controls the DAC disable (not power-save mode) and normal operation.

Default value: 0.

**PSMDA Power-save mode selection**

|   |                                  |
|---|----------------------------------|
| 0 | Power-save enable mode (default) |
| 1 | Power-save disable mode          |

**RSV Reserved**

Reserved; do not use.

**FMTDA[2:0] Audio interface format selection**

These bits control the audio interface format for DAC operation. Details of the format and any related restrictions with the system clock are described in the [Audio Data Interface Formats and Timing](#) section.

Default value: 0000 (16-/20-/24-/32-bit I<sup>2</sup>S format).

**FMTDA Audio interface format selection**

|     |                                                      |
|-----|------------------------------------------------------|
| 000 | 16-/20-/24-/32-bit I <sup>2</sup> S format (default) |
| 001 | 16-/20-/24-/32-bit left-justified format             |
| 010 | 24-bit right-justified format                        |
| 011 | 16-bit right-justified format                        |
| 100 | 24-bit I <sup>2</sup> S mode DSP format              |
| 101 | 24-bit left-justified mode DSP format                |
| 110 | Reserved                                             |
| 111 | Reserved                                             |

| DEC | HEX | B7  | B6  | B5  | B4    | B3  | B2  | B1  | B0  |
|-----|-----|-----|-----|-----|-------|-----|-----|-----|-----|
| 18  | 12  | RSV | RSV | RSV | OPEDA | RSV | RSV | RSV | FLT |

**RSV**      **Reserved**

Reserved; do not use.

**OPEDA**      **Operation control**

This bit controls the DAC operation mode. In operation disable mode, the DAC output is cut off from DIN and the internal DAC data are reset. If PSMDA = 1, the DAC output is forced into VCOM. If PSMDA = 0, the DAC output is forced into AGND and the DAC goes into a power-down state. For normal operating mode, this bit must be '0'. The serial mode control is effective during operation disable mode.

Default value: 0.

**OPEDA**      **Operation control**

- 0      Normal operation
- 1      Operation disable with or without power save

**FLT**      **Digital filter roll-off control**

This bit allows users to select the digital filter roll-off that is best suited to their applications. Sharp and slow filter roll-off selections are available. The filter responses for these selections are shown in the [Typical Characteristics](#) sections of this data sheet.

Default value: 0.

**FLT**      **Digital filter roll-off control**

- 0      Sharp roll-off
- 1      Slow roll-off

| DEC | HEX | B7  | B6  | B5  | B4  | B3  | B2  | B1     | B0     |
|-----|-----|-----|-----|-----|-----|-----|-----|--------|--------|
| 19  | 13  | RSV | RSV | RSV | RSV | RSV | RSV | REVDA2 | REVDA1 |

**RSV**      **Reserved**

Reserved; do not use.

**REVDA[2:1]**      **Output phase selection**

These bits are used to control the phase of the DAC analog signal outputs.

Default value: 00.

**REVDA**      **Output phase selection**

- x0      Left channel normal output
- x1      Left channel inverted output
- 0x      Right channel normal output

**RSV      Reserved**

Reserved; do not use.

**MUTDA[2:1]    Soft Mute control**

These bits are used to enable or disable the Soft Mute function for the corresponding DAC outputs, VOUTx. The Soft Mute function is incorporated into the digital attenuators. When mute is disabled (MUTDA[2:1] = 0), the attenuator and DAC operate normally. When mute is enabled by setting MUTDA[2:1] = 1, the digital attenuator for the corresponding output is decreased from the current setting to infinite attenuation. By setting MUTDA[2:1] = 0, the attenuator is increased to the last attenuation level in the same manner as it is for decreasing levels. This configuration reduces *pop and zipper noise* during muting of the DAC output. This Soft Mute control uses the same resource of digital attenuation level setting. Mute control has priority over the digital attenuation level setting.

Default value: 00.

**MUTDA    Soft Mute control**

**RSV Reserved**

Reserved; do not use.

**ATDAx[7:0] Digital attenuation level setting**

Where  $x = 1$  to 2, corresponding to the DAC output (VOUTx).

Both DAC outputs (VOUTL and VOUTR) have a digital attenuation function. The attenuation level can be set from 0 dB to R dB, in S-dB steps. Changes in attenuator levels are made by incrementing or decrementing one step (S dB) for every  $8/f_s$  time interval until the programmed attenuator setting is reached. Alternatively, the attenuation level can be set to infinite attenuation (or mute). R (range) and S (step) is –63 and 0.5 for DAMS = 0, and –100 and 1.0 for DAMS = 1, respectively. The DAMS bit is defined in register 22 (16h). [Table 15](#) shows attenuation levels for various settings.

The attenuation level for each channel can be set individually using the following formula:

$$\text{Attenuation level (dB)} = S \times (\text{ATDAx}[7:0]_{\text{DEC}} - 255)$$

where  $\text{ATDAx}[7:0]_{\text{DEC}} = 0$  through 255.

For  $\text{ATDAx}[7:0]_{\text{DEC}} = 0$  through 128 with DAMS = 0, or 0 through 154 with DAMS = 1, attenuation is set to infinite attenuation (mute).

Default value: 1111 1111.

**Table 15. Attenuation Levels for Various Settings**

| ATDAx[7:0] |         | ATTENUATION LEVEL SETTING      |                                |
|------------|---------|--------------------------------|--------------------------------|
| BINARY     | DECIMAL | DAMS = 0                       | DAMS = 1                       |
| 1111 1111  | 255     | 0 dB, no attenuation (default) | 0 dB, no attenuation (default) |
| 1111 1110  | 254     | –0.5 dB                        | –1 dB                          |
| 1111 1101  | 253     | –1.0 dB                        | –2 dB                          |
| ...        | ...     | ...                            | ...                            |
| 1001 1100  | 156     | –45.9 dB                       | –99 dB                         |

| ...        | ...     | ...                            | ...                            |
| 0000 0000  | 0       | Mute                           | Mute                           |

## APPLICATION INFORMATION

### CONNECTION DIAGRAMS

A basic connection diagram is shown in [Figure 37](#), with the necessary power-supply bypassing and decoupling components. Texas Instruments' [PLL170X](#) is used to generate the system clock input at SCKI, as well as to generate the clock for the audio signal processor. The use of series resistors (22  $\Omega$  to 100  $\Omega$ ) are recommended for SCKI, LRCK, BCK, and DIN for electromagnetic interference (EMI) reduction.

NOTE:  $C_1$  through  $C_3$  are 1- $\mu$ F ceramic capacitors.  $C_4$  through  $C_6$  are 10- $\mu$ F electrolytic capacitors.  $R_1$  through  $R_4$  are 22- $\Omega$  to 100- $\Omega$  resistors.  $R_5$  is a resistor appropriate for pull-up.  $R_6$  is a 220-k $\Omega$  resistor,  $\pm 5\%$ . An appropriate resistor is required for pull-up, if ZERO2/AMUTE0 pin is used as AMUTE0.

**Figure 37. Basic Connection Diagram**

### POWER SUPPLY AND GROUNDING

The PCM1789-Q1 requires +5 V for the analog supply and +3.3 V for the digital supply. The +5-V supply is used to power the DAC analog and output filter circuitry, and the +3.3-V supply is used to power the digital filter and serial interface circuitry. For best performance, it is recommended to use a linear regulator (such as the [REG101-5/33](#), [REG102-5/33](#), or [REG103-5/33](#)) with the +5-V and +3.3-V supplies.

Five capacitors are required for supply bypassing, as shown in [Figure 37](#). These capacitors should be located as close as possible to the PCM1789-Q1 package. The 10- $\mu$ F capacitors are aluminum electrolytic, while the three 1- $\mu$ F capacitors are ceramic.

## LOW-PASS FILTER AND DIFFERENTIAL-TO-SINGLE-ENDED CONVERTER FOR DAC OUTPUTS

$\Delta\Sigma$  DACs use noise-shaping techniques to improve in-band signal-to-noise ratio (SNR) performance at the expense of generating increased out-of-band noise above the Nyquist frequency, or  $f_s/2$ . The out-of-band noise must be low-pass filtered in order to provide optimal converter performance. This filtering is accomplished by a combination of on-chip and external low-pass filters.

Figure 38 and Figure 39 show the recommended external differential-to-single-ended converter with low-pass active filter circuits for ac-coupled and dc-coupled applications. These circuits are second-order Butterworth filters using a multiple feedback (MFB) circuit arrangement that reduces sensitivity to passive component variations over frequency and temperature. For more information regarding MFB active filter designs, please refer to Applications Bulletin [SBAA055](#), *Dynamic Performance Testing of Digital Audio D/A Converters*, available from the TI web site ([www.ti.com](http://www.ti.com)) or your local Texas Instruments' sales office.

Because the overall system performance is defined by the quality of the DACs and the associated analog output circuitry, high-quality audio op amps are recommended for the active filters. Texas Instruments' [OPA2134](#), [OPA2353](#), and [NE5532A](#) dual op amps are shown in Figure 38 and Figure 39, and are recommended for use with the PCM1789-Q1.

NOTE: Amplifier is an NE5532A x 1/2 or OPA2134 x1/2;  $R_1 = 7.5 \text{ k}\Omega$ ;  $R_2 = 5.6 \text{ k}\Omega$ ;  $R_3 = 360 \text{ }\Omega$ ;  $C_1 = 3300 \text{ pF}$ ;  $C_2 = 680 \text{ pF}$ ; Gain = 0.747;  $f_{-3 \text{ dB}} = 53 \text{ kHz}$ .

**Figure 38. AC-Coupled, Post-LPF and Differential to Single-Ended Buffer**

NOTE: Amplifier is an NE5532A x 1/2 or OPA2134 x1/2;  $R_1 = 15 \text{ k}\Omega$ ;  $R_2 = 11 \text{ k}\Omega$ ;  $R_3 = 820 \text{ }\Omega$ ;  $C_1 = 1500 \text{ pF}$ ;  $C_2 = 330 \text{ pF}$ ; Gain = 0.733;  $f_{-3 \text{ dB}} = 54 \text{ kHz}$ .

**Figure 39. DC-Coupled, Post-LPF and Differential to Single-Ended Buffer**

## PCB LAYOUT GUIDELINES

A typical printed circuit board (PCB) layout for the PCM1789-Q1 is shown in Figure 40. A ground plane is recommended, with the analog and digital sections being isolated from one another using a split or cut in the circuit board. The PCM1789-Q1 should be oriented with the digital I/O pins facing the ground plane split/cut to allow for short, direct connections to the digital audio interface and control signals originating from the digital section of the board.

Separate power supplies are recommended for the digital and analog sections of the board. This configuration prevents the switching noise present on the digital supply from contaminating the analog power supply and degrading the dynamic performance of the PCM1789-Q1.

Figure 40. Recommended PCB Layout

**PACKAGING INFORMATION**

| Orderable Device | Status <sup>(1)</sup> | Package Type | Package Drawing | Pins | Package Qty | Eco Plan <sup>(2)</sup> | Lead/ Ball Finish | MSL Peak Temp <sup>(3)</sup> | Samples (Requires Login) |
|------------------|-----------------------|--------------|-----------------|------|-------------|-------------------------|-------------------|------------------------------|--------------------------|
| PCM1789IPWRQ1    | PREVIEW               | TSSOP        | PW              | 24   | 2000        | Green (RoHS & no Sb/Br) | CU NIPDAU         | Level-3-260C-168 HR          |                          |
| PCM1789TPWRQ1    | ACTIVE                | TSSOP        | PW              | 24   | 2000        | Green (RoHS & no Sb/Br) | CU NIPDAU         | Level-3-260C-168 HR          |                          |

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Publication IPC-7351 is recommended for alternate design.
  - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
  - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46C and to discontinue any product or service per JESD48B. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components which meet ISO/TS16949 requirements, mainly for automotive use. Components which have not been so designated are neither designed nor intended for automotive use; and TI will not be responsible for any failure of such components to meet such requirements.
