

1 A very low drop voltage regulator

DFN6 (2x2)

DFN6 (3x3)

Features

- Input voltage from 2.6 to 16 V
- Very low-dropout voltage (500 mV max. at 1 A load)
- Low quiescent current (200 μ A typ. @ 1 A load)
- Available in 1% precision in DFN6 package
- 1 A guaranteed output current
- Wide range of output voltages available on request: adjustable from 0.8 V
- Logic-controlled electronic shutdown
- Power Good DFN package
- Fast dynamic response to line and load changes
- Internal current and thermal protections
- Temperature range: -40 °C to 125 °C

Applications

- Computer and laptop
- Battery-powered equipments
- Industrial and medical equipment
- Consumer and set-top box

Description

The LDF is a fast, very low drop linear regulator which operates from an input supply voltage in the range of 2.6 V to 16 V.

It is available in adjustable output voltage versions, from 0.8 V to 12 V.

The LDF features are: high output precision, very low-dropout voltage, low noise, and low quiescent current, therefore suitable for low voltage microprocessors and memory applications.

Enable logic control pin and Power Good output are featured on DFN package.

Current and thermal protection are provided.

1. For $V_{OUT} < 1.6\text{ V}$; $V_{IN} = 2.6\text{ V}$.

2. Dropout voltage is the input-to-output voltage difference at which the output voltage is 100 mV below its nominal value. This specification does not apply to output voltages below 1.6 V.

5 Application information

5.1 External capacitors

The LDF voltage regulator requires external ceramic capacitors to assure the control loop stability. These capacitors must be selected to meet the requirements of minimum capacitance and equivalent series resistance (see [Section 6: Typical characteristics](#) and [Section 6: Typical characteristics](#). Input/output capacitors should be located as closer as possible to the relative pins.

5.1.1 Input capacitor

An input capacitor, whose minimum value is 1 μF , must not be located farther than 0.5" from the input pin of the device and returned to a clean analog ground.

5.1.2 Output capacitor

Ceramic capacitors could be used on the output, provided that they must meet the minimum amount of capacitance and E.S.R. (equivalent series resistance) value required. 2.2 μF is suggested as minimum capacitance to guarantee the stability of the regulator. Anyway, other COUT values can be used according to the [Section 6: Typical characteristics](#) and [Section 6: Typical characteristics](#) showing the allowable ESR range as a function of the output capacitance. The output capacitor must maintain its ESR in the stable region over the full operating temperature range to assure stability. Besides, capacitor tolerance and temperature variation must be taken into account to assure the minimum amount of capacitance.

5.2 Output voltage setting for ADJ version

In the adjustable version, the output voltage can be set from 0.8 V up to the input voltage minus the voltage drop across the pass transistor (dropout voltage), by connecting a resistor divider between the ADJ pin and the output, thus allowing remote voltage sensing.

The resistor divider could be selected by the following equation:

$$V_{OUT} = V_{ADJ} \left(1 + \frac{R1}{R2} \right), \text{ with } V_{ADJ} = 0.8 \text{ V (Typ.)} \quad (1)$$

It is recommended to use resistors with values in the range of 10 k Ω to 100 k Ω . Lower values can also be suitable, but current consumption increases.

5.3 Enable pin operation

This pin can be used to turn OFF the regulator when it is pulled down, so to drastically reduce the current consumption. When the enable feature is not used, this pin must be tied to V_{IN} to keep the regulator output in ON state every time. To assure the proper operation, the signal source, used to drive the EN pin, must be able to swing above and below the specified thresholds listed in the electrical characteristics (V_{EN}). The EN pin must not be left floating because it is not internally pulled down/up.

5.4 Power Good

The LDF features an open drain PG pin to sequence either external supplies or loads and to provide fault detection. This pin requires an external resistor (R_{PG}) to pull Power Good high when the output is within the power-good tolerance window. Typical values for this resistor range from 10 k Ω to 100 k Ω .

6 Typical characteristics

$C_{IN} = C_{OUT} = 1 \mu F$, $V_{IN} = V_{OUT} + 1 V$, V_{EN} to V_{IN} , $I_{OUT} = 10 \text{ mA}$, unless otherwise specified.
