### **Legal Disclaimer**

The information given in this document shall in no event be regarded as a guarantee of conditions or characteristics. With respect to any examples or hints given herein, any typical values stated herein and/or any information regarding the application of the device, Infineon Technologies hereby disclaims any and all warranties and liabilities of any kind, including without limitation, warranties of non-infringement of intellectual property rights of any third party.

### **Information**

For further information on technology, delivery terms and conditions and prices, please contact the nearest Infineon Technologies Office ([www.infineon.com](http://www.infineon.com)).

### **Warnings**

Due to technical requirements, components may contain dangerous substances. For information on the types in question, please contact the nearest Infineon Technologies Office.

Infineon Technologies components may be used in life-support devices or systems only with the express written approval of Infineon Technologies, if a failure of such components can reasonably be expected to cause the failure of that life-support device or system or to affect the safety or effectiveness of that device or system. Life support devices or systems are intended to be implanted in the human body or to support and/or maintain and sustain and/or protect human life. If they fail, it is reasonable to assume that the health of the user or other persons may be endangered.

Figure 1-1 Image of TLE4968-1K in the PG-SC59-3-5 Package

## 1.2 Features

- 3.0 V to 32 V operating supply voltage
- Operation from unregulated power supply
- Reverse polarity protection (-18 V)
- Overvoltage capability up to 42 V without external resistor
- Output overcurrent & overtemperature protection
- Active error compensation
- High stability of magnetic thresholds
- Low jitter (typ. 0.35 µs)
- High ESD performance
- SOT23 like SMD package PG-SC59-3-5 (TLE4968-1K)

## 1.3 Target Applications

Target applications for the TLE496x Hall switch family are all applications which require a high precision Hall switch with an operating temperature range from -40°C to 170°C. Its superior supply voltage range from 3.0 V to 32 V with overvoltage capability (e.g. load-dump) up to 42 V without external resistor makes it ideally suited for automotive and industrial applications.

The TLE4968-1K has very low magnetic thresholds and a bipolar switching behavior. It is therefore especially suited for applications which require a high sensitivity device and an output switching close to zero magnetic field values. Possible applications are BLDC rotor position measurement or speed and position measurements in camshaft or transmission applications.

Table 1-1 Ordering Information

| Product Name | Product Type       | Ordering Code | Package     |
|--------------|--------------------|---------------|-------------|
| TLE4968-1K   | Bipolar Hall Latch | SP000847992   | PG-SC59-3-5 |

## 2 Functional Description

### 2.1 General

The TLE4968-1K is an integrated Hall effect switch designed specifically for highly accurate applications with superior supply voltage capability, operating temperature range and temperature stability of the magnetic thresholds.

### 2.2 Pin Configuration (top view)

Figure 2-1 Pin Configuration and Center of Sensitive Area

### 2.3 Pin Description

Table 2-1 Pin Description PG-SC59-3-5

| Pin No. | Symbol | Function       |
|---------|--------|----------------|
| 1       | VDD    | Supply voltage |
| 2       | Q      | Output         |
| 3       | GND    | Ground         |

## 2.4 Block Diagram

**Figure 2-2 Functional Block Diagram TLE4968-1K**

## 2.5 Functional Block Description

The chopped Hall IC switch comprises a Hall probe, bias generator, compensation circuits, oscillator and output transistor.

The bias generator provides currents for the Hall probe and the active circuits. Compensation circuits stabilize the temperature behavior and reduce influence of technology variations.

The active error compensation (chopping technique) rejects offsets in the signal path and the influence of mechanical stress to the Hall probe caused by molding and soldering processes and other thermal stress in the package. The chopped measurement principle together with the threshold generator and the comparator ensures highly accurate and temperature stable magnetic thresholds.

The output transistor has an integrated overcurrent and overtemperature protection.

Figure 2-3 Timing Diagram TLE4968-1K

Figure 2-4 Output Signal TLE4968-1K

## 2.6 Start-up Behavior

The magnetic thresholds exhibit a hysteresis  $B_{HYS} = B_{OP} - B_{RP}$ . In case of a power-on with a magnetic field  $B$  within hysteresis ( $B_{OP} > B > B_{RP}$ ) the output of the sensor is set to the pull up voltage level ( $V_Q$ ) per default. After the first crossing of  $B_{OP}$  or  $B_{RP}$  of the magnetic field the internal decision logic is set to the corresponding magnetic input value.

This means for  $B > B_{OP}$  the output is switching, for  $B < B_{RP}$  and  $B_{OP} > B > B_{RP}$  the output stays at  $V_Q$ .

Figure 2-5 Illustration of the Start-up Behavior of the TLE4968-1K

### 3 Specification

#### 3.1 Application Circuit

The following **Figure 3-1** shows one option of an application circuit. As explained above the resistor  $R_S$  can be left out (see **Figure 3-2**). The resistor  $R_Q$  has to be in a dimension to match the applied  $V_S$  to keep  $I_Q$  limited to the operating range of maximum 25 mA.

e.g.:

$$V_S = 12 \text{ V}$$

$$I_Q = 12 \text{ V} / 1200 \text{ } \Omega = 10 \text{ mA}$$

**Figure 3-1 Application Circuit 1: With External Resistor**

**Figure 3-2 Application Circuit 2: Without External Resistor**

## 3.2 Absolute Maximum Ratings

**Table 3-1 Absolute Maximum Rating Parameters**

| Parameter                              | Symbol            | Values |      |                          | Unit | Note / Test Condition                                                                                    |

1) This lifetime statement is an anticipation based on an extrapolation of Infineon's qualification test results. The actual lifetime of a component depends on its form of application and type of use etc. and may deviate from such statement. The lifetime statement shall in no event extend the agreed warranty period.

**Attention: Stresses above the max. values listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Maximum ratings are absolute ratings; exceeding only one of these values may cause irreversible damage to the integrated circuit.**

Calculation of the dissipated power P<sub>DIS</sub> and junction temperature T<sub>J</sub> of the chip (SC59 example):

e.g for: V<sub>DD</sub> = 12 V, I<sub>S</sub> = 2.5 mA, V<sub>QSAT</sub> = 0.5 V, I<sub>Q</sub> = 20 mA

Power dissipation: P<sub>DIS</sub> = 12 V x 2.5 mA + 0.5 V x 20 mA = 30 mW + 10 mW = 40 mW

Temperature ΔT = R<sub>thJA</sub> x P<sub>DIS</sub> = 300 K/W x 40 mW = 12 K

For T<sub>A</sub> = 150 °C: T<sub>J</sub> = T<sub>A</sub> + ΔT = 150 °C + 12 K = 162 °C

**Table 3-2 ESD Protection<sup>1)</sup> (TA = 25°C)**

1) Characterization of ESD is carried out on a sample basis, not subject to production test.

2) Human Body Model (HBM) tests according to EIA/JESD22-A114.

3) Socket device model (SDM) tests according to EOS/ESD-DS5.3-1993.

4) Gun test (2kΩ / 330pF or 330Ω / 150pF) according to ISO 10605-2008.

### 3.3 Operating Range

The following operating conditions must not be exceeded in order to ensure correct operation of the TLE4968-1K. All parameters specified in the following sections refer to these operating conditions unless otherwise mentioned.

**Table 3-3 Operating Conditions Parameters**

| Parameter                                     | Symbol   | Values |      |                  | Unit | Note / Test Condition |
|-----------------------------------------------|----------|--------|------|------------------|------|-----------------------|
|                                               |          | Min.   | Typ. | Max.             |      |                       |
| Supply voltage                                | $V_{DD}$ | 3.0    |      | 32 <sup>1)</sup> | V    |                       |
| Output voltage                                | $V_Q$    | -0.3   |      | 32               | V    |                       |
| Junction temperature                          | $T_j$    | -40    |      | 170              | °C   |                       |
| Output current                                | $I_Q$    | 0      |      | 25               | mA   |                       |
| Magnetic signal input frequency <sup>2)</sup> | $f_{SW}$ | 0      |      | 10               | kHz  |                       |

1) Latch-up test with factor 1.5 is not covered. Please see max ratings also.

2) For operation at the maximum switching frequency the magnetic input signal must be 1.4 times higher than for static fields. This is due to the -3dB corner frequency of the internal low-pass filter in the signal path.

### 3.4 Electrical and Magnetic Characteristics

Product characteristics involve the spread of values guaranteed within the specified voltage and ambient temperature range. Typical characteristics are the median of the production and correspond to  $V_{DD} = 12\text{ V}$  and  $T_A = 25^\circ\text{C}$ . The below listed specification is valid in combination with the application circuit shown in [Figure 3-1](#) and [Figure 3-2](#)

**Table 3-4 General Electrical Characteristics**

| Parameter                       | Symbol       | Values |      |      | Unit          | Note / Test Condition                                                                      |
|---------------------------------|--------------|--------|------|------|---------------|--------------------------------------------------------------------------------------------|
|                                 |              | Min.   | Typ. | Max. |               |                                                                                            |
| Supply current                  | $I_S$        | 1.1    | 1.6  | 2.5  | mA            |                                                                                            |
| Reverse current                 | $I_{SR}$     |        | 0.05 | 1    | mA            | for $V_{DD} = -18\text{ V}$                                                                |
| Output saturation voltage       | $V_{QSAT}$   |        | 0.2  | 0.5  | V             | $I_Q = 20\text{ mA}$                                                                       |
|                                 |              |        | 0.24 | 0.6  | V             | $I_Q = 25\text{ mA}$                                                                       |
| Output leakage current          | $I_{QLEAK}$  |        |      | 10   | $\mu\text{A}$ |                                                                                            |
| Output current limitation       | $I_{QLIMIT}$ | 30     | 56   | 70   | mA            | internally limited & thermal shutdown                                                      |
| Output fall time <sup>1)</sup>  | $t_f$        | 0.17   | 0.4  | 1    | $\mu\text{s}$ | 1.2 k $\Omega$ / 50 pF, see <a href="#">Figure 2-3</a>                                     |
| Output rise time <sup>1)</sup>  | $t_r$        | 0.4    | 0.5  | 1    | $\mu\text{s}$ | 1.2 k $\Omega$ / 50 pF, see <a href="#">Figure 2-3</a>                                     |
| Output jitter <sup>1)2)</sup>   | $t_{QJ}$     |        | 0.35 | 1    | $\mu\text{s}$ | For square wave signal with 1 kHz                                                          |
| Delay time <sup>1)3)</sup>      | $t_d$        | 12     | 15   | 30   | $\mu\text{s}$ | see <a href="#">Figure 2-3</a>                                                             |
| Power-on time <sup>1)4)</sup>   | $t_{PON}$    |        | 80   | 150  | $\mu\text{s}$ | $V_{DD} = 3\text{ V}$ , $B \leq B_{RP} - 0.5\text{ mT}$ or $B \geq B_{OP} + 0.5\text{ mT}$ |
| Chopper frequency <sup>1)</sup> | $f_{OSC}$    |        | 350  |      | kHz           |                                                                                            |

1) Not subject to production test, verified by design/characterization.

2) Output jitter is the  $1\sigma$  value of the output switching distribution.

3) Systematic delay between magnetic threshold reached and output switching.

4) Time from applying  $V_{DD} = 3.0\text{ V}$  to the sensor until the output is valid.

**Table 3-5 Magnetic Characteristics**

| Parameter                                                            | Symbol            | T (°C)    | Values |      |      | Unit  | Note / Test Condition |
|----------------------------------------------------------------------|-------------------|-----------|--------|------|------|-------|-----------------------|
|                                                                      |                   |           | Min.   | Typ. | Max. |       |                       |
| Operating point                                                      | B <sub>OP</sub>   | -40...170 | -0.2   | 1.0  | 2.25 | mT    |                       |
| Release point                                                        | B <sub>RP</sub>   | -40...170 | -2.25  | -1.0 | 0.2  | mT    |                       |
| Hysteresis                                                           | B <sub>HYS</sub>  | -40...170 | 1.1    | 2.0  | 2.9  | mT    |                       |
| Effective noise value of the magnetic switching points <sup>1)</sup> | B <sub>Neff</sub> | 25        |        | 62   |      | μT    |                       |
| Temperature compensation of magnetic thresholds <sup>2)</sup>        | T <sub>C</sub>    |           |        | 0    |      | ppm/K |                       |

- 1) The magnetic noise is normal distributed and can be assumed as nearly independent to frequency without sampling noise or digital noise effects. The typical value represents a the rms-value and corresponds therefore to a 1  $\sigma$  probability of normal distribution. Consequently a 3  $\sigma$  value corresponds to 99.7% probability of appearance.
- 2) Not subject to production test, verified by design/characterization.

### Field Direction Definition

Positive magnetic fields are defined with the south pole of the magnet to the branded side of package.

**Figure 3-3 Definition of Magnetic Field Direction PG-SC59-3-5**

### 3.5 Electro Magnetic Compatibility

Characterization of Electro Magnetic Compatibility is carried out on a sample basis from one qualification lot. Not all specification parameters have been monitored during EMC exposure.

**Figure 3-4 EMC Test Circuit**

Ref: ISO 7637-2 (Version 2004), test circuit [Figure 3.4](#) (with external resistor,  $R_S = 100 \Omega$ )

**Table 3-6 Magnetic Compatibility**

| Parameter                  | Symbol    | Level / Type                                    | Status |
|----------------------------|-----------|-------------------------------------------------|--------|
| Testpulse 1                | $V_{EMC}$ | -100 V                                          | C      |
| Testpulse 2a <sup>1)</sup> |           | 60 V/110 V                                      | A/C    |
| Testpulse 2b               |           | 10 V                                            | C      |
| Testpulse 3a               |           | -150 V                                          | A      |
| Testpulse 3b               |           | 100 V                                           | A      |
| Testpulse 4 <sup>2)</sup>  |           | -7 V / -5.5 V                                   | A      |
| Testpulse 5b <sup>3)</sup> |           | $U_S = 86.5 \text{ V} / U_S^* = 28.5 \text{ V}$ | A      |

1) ISO 7637-2 (2004) describes internal resistance = 2  $\Omega$  (former 10  $\Omega$ ).

2) According to 7637-2 for test pulse 4 the test voltage shall be 12 V +/- 0.2 V.

3) A central load dump protection of 42 V is used.  $U_S^* = 42 \text{ V}$ -13.5 V.

Ref: ISO 7637-2 (Version 2004), test circuit [Figure 3.4](#) (without external resistor,  $R_S = 0 \Omega$ )

**Table 3-7 Electro Magnetic Compatibility**

| Parameter                  | Symbol    | Level / Type                                    | Status |
|----------------------------|-----------|-------------------------------------------------|--------|
| Testpulse 1                | $V_{EMC}$ | -50 V                                           | C      |
| Testpulse 2a <sup>1)</sup> |           | 50 V                                            | A      |
| Testpulse 2b               |           | 10 V                                            | C      |
| Testpulse 3a               |           | -150 V                                          | A      |
| Testpulse 3b               |           | 100 V                                           | A      |
| Testpulse 4 <sup>2)</sup>  |           | -7 V / 5.5 V                                    | A      |
| Testpulse 5b <sup>3)</sup> |           | $U_S = 86.5 \text{ V} / U_S^* = 28.5 \text{ V}$ | A      |

1) ISO 7637-2 (2004) describes internal resistance = 2  $\Omega$  (former 10  $\Omega$ ).

2) According to 7637-2 for test pulse 4 the test voltage shall be 12 V +/- 0.2 V.

3) A central load dump protection of 42 V is used.  $U_S^* = 42 \text{ V}$ -13.5 V.

## 4 Package Information

The TLE4968-1K is available in the halogen free SMD package PG-SC59-3-5 with a SOT23 like pinout and footprint.
