

MAX6806/MAX6807/ MAX6808

Voltage Detectors

General Description

The MAX6806/MAX6807/MAX6808 precision voltage detectors are ideal for accurate monitoring of power supplies in digital systems. They provide circuit reliability and reduce total cost by eliminating external components and adjustments.

The MAX6806/MAX6807/MAX6808 assert a reset signal whenever the supply voltage (V_{CC}) falls below the factory-preset, $\pm 2\%$ accurate threshold. Internal hysteresis ensures stable switching. The MAX6806/MAX6807/MAX6808 are available in 4.6V and 2.6V thresholds (2.3V is also available for the MAX6806 only). The MAX6806 features an active-low, push-pull RESET output; the MAX6807 features an active-high, push-pull RESET output; and the MAX6808 features an active-low, open-drain RESET output. RESET is valid for V_{CC} down to 1V (MAX6806/MAX6808), and RESET (MAX6807) is guaranteed for V_{CC} down to 1.2V.

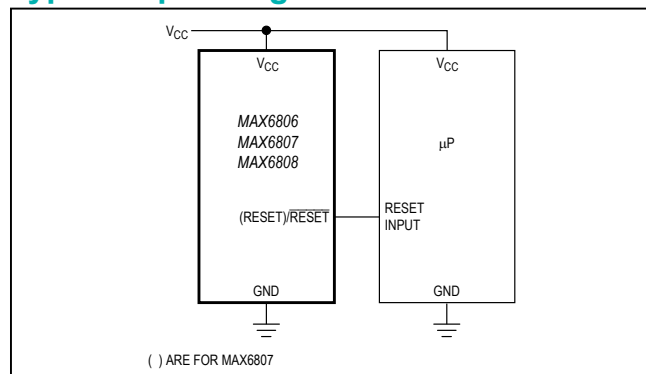

The MAX6806/MAX6807/MAX6808 are available in 3-pin SC70, 3-pin SOT23, 8-pin μ MAX, 8-pin SO, and 4-pin SOT143 packages. The SOT143 package includes a manual-reset input.

Detailed Description

Reset Output

The MAX6806 voltage detector features an active-low, push-pull $\overline{\text{RESET}}$ output, while the MAX6807 features an active-high, push-pull RESET output. Unlike microprocessor (μP) supervisory circuits that offer a reset timeout period, the MAX6806 and MAX6807 RESET goes high and $\overline{\text{RESET}}$ goes low virtually immediately once V_{CC} exceeds the reset threshold. If a brownout occurs (V_{CC} falls below the reset threshold), $\overline{\text{RESET}}$ goes low and RESET goes high. $\overline{\text{RESET}}$ is guaranteed to be a logic low for $V_{\text{CC}} \geq 1\text{V}$ and RESET is guaranteed to be a logic high for $V_{\text{CC}} \geq 1.2\text{V}$.

The MAX6808 features an active-low, open-drain $\overline{\text{RESET}}$ output. The output sinks current when V_{CC} falls below the reset threshold. Connect a pullup resistor from $\overline{\text{RESET}}$ to any supply voltage up to 6V (Figure 1). Select a resistor value large enough to provide a logic low and small enough to provide a logic high while supplying all input and leakage currents connected to the $\overline{\text{RESET}}$ line. A 100k Ω resistor is sufficient in applications driving high-impedance loads.

The manual reset input (MR, 4-pin SOT143 package) can also initiate a reset (see Manual Reset Input section).

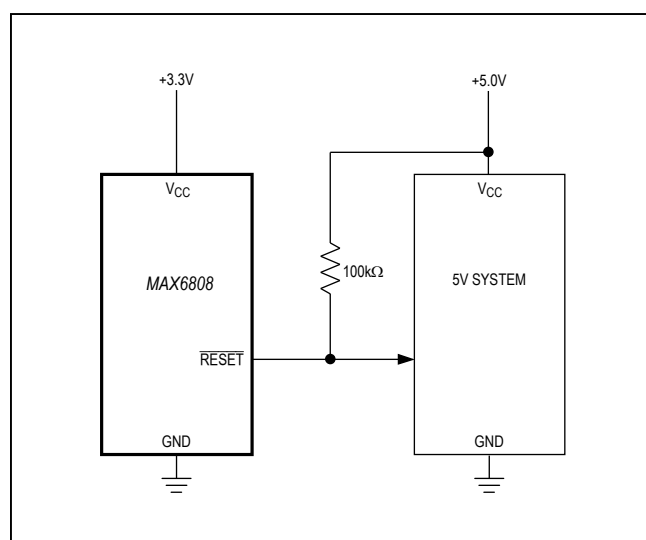

Figure 1. The MAX6808 Open-Drain $\overline{\text{RESET}}$ Output Allows Use with Multiple Supplies

Manual-Reset Input

Many applications require manual-reset capabilities, allowing an operator, a test technician, or external logic circuitry to initiate a reset. A logic high on MR asserts a reset and remains asserted while MR is high. This input has an 80k Ω pulldown resistor, so the input can be left unconnected if not used. Connect a normally open momentary switch from MR to V_{CC} to create a manual-reset function. If MR is driven from long cables or if the device is used in a noisy environment, connecting a 0.1 μF capacitor from MR to ground provides noise immunity.

Hysteresis

The MAX6806/MAX6807/MAX6808 feature internal hysteresis that creates two trip points: one for the rising supply voltage and one for the falling supply voltage (Figure 2). The hysteresis prevents the output from oscillating (chattering) when V_{CC} is near the reset threshold.

Reset Threshold Accuracy

The MAX6806/MAX6807/MAX6808 are ideal for systems using a 5V $\pm 5\%$, 3V $\pm 5\%$, or 2.5V $\pm 5\%$ power supply with ICs specified for 5V $\pm 10\%$, 3V $\pm 10\%$, or 2.5V $\pm 10\%$, respectively. The reset is guaranteed to assert after the power supply falls out of regulation, but before power drops below the minimum specified operating voltage range for the system ICs.

Applications Information

Negative-Going V_{CC} Transients

In addition to asserting a reset signal during power-up, power-down, and brown-out conditions, the MAX6806/MAX6807/MAX6808 are immune to short-duration, negative-going V_{CC} transients.

Figure 3 displays typical transient durations vs. reset-comparator overdrive for which the MAX6806/MAX6807/MAX6808 do **not** generate a reset pulse. The graph was generated using a negative-going pulse applied to V_{CC} , starting 0.5V above the actual reset threshold and ending below it by the magnitude indicated (reset-comparator overdrive). The graph indicates the maximum pulse width a negative-going V_{CC} transient can have without causing a reset pulse. As the magnitude of the transient increases (goes further below the reset threshold), the maximum allowable pulse width decreases. A 0.1 μ F capacitor mounted as close as possible to V_{CC} provides additional transient immunity.

Figure 3. Maximum Transient Duration without Causing a Reset Pulse vs. Reset Comparator Overdrive

Ensuring a Valid Reset Output Down to $V_{CC} = \text{Ground}$

When V_{CC} falls below 1V, the MAX6806/MAX6808 $\overline{\text{RESET}}$ output no longer sinks current—it becomes an open circuit. Therefore, high-impedance CMOS logic inputs connected to $\overline{\text{RESET}}$ can drift to undetermined voltages. This presents no problem in most applications, since most circuitry is inoperative when V_{CC} is below 1V. In applications where $\overline{\text{RESET}}$ must be valid down to ground, add a pulldown resistor to $\overline{\text{RESET}}$ so any stray leakage currents flow to ground, holding $\overline{\text{RESET}}$ low (Figure 4). Select R1 to be large enough not to load $\overline{\text{RESET}}$ and small enough to pull $\overline{\text{RESET}}$ to ground. For most applications, 100k Ω will not load $\overline{\text{RESET}}$ and will pull $\overline{\text{RESET}}$ to ground. Similarly, if RESET (MAX6807) must be valid below 1.2V, add a pullup resistor to RESET.

Interfacing to μ Ps with Bidirectional Reset Pins

μ Ps with bidirectional reset pins (such as the Motorola 68HC11 series) can contend with push-pull RESET outputs, resulting in indeterminate logic levels. Use the MAX6808 with the open-drain RESET when interfacing to this type of controller.
