- Power conservation
- Capacitance reduction and isolation
- Bus isolation
- Clock gating

DESCRIPTION:

The QS32X861 provides two sets of ten high-speed CMOS TTL-compatible bus switches. The low ON resistance of the QS32X861 allows inputs to be connected to outputs without adding propagation delay and without generating additional ground bounce noise. The Bus Enable ($\overline{BEn}$) signals turn the switches on.

The QS32X861 bus switch is ideal for switching digital buses, as well as for hotplug buffering and 5V to 3V conversion.

The QS32X861 is characterized for operation at -40°C to +85°C.

SWITCHING CHARACTERISTICS OVER OPERATING RANGE

T_A = -40°C to +85°C, V_{CC} = 5.0V ± 5%;

C_{LOAD} = 50pF, R_{LOAD} = 500Ω unless otherwise noted.

Symbol	Parameter	Min.[1]	Typ.	Max.	Unit
t_{PLH}	Data Propagation Delay [2,3]	—	0.25	—	ns
t_{PHL}	An to/from Bn				
t_{PZH}	Switch Turn-on Delay	1.5	—	6.5	ns
t_{PZL}	$\overline{BEn}$ to An/Bn				
t_{PHZ}	Switch Turn-off Delay [2]	1.5	—	5.5	ns
t_{PLZ}	$\overline{BEn}$ to An/Bn				

NOTES:
1. Minimums are guaranteed but not production tested.
2. This parameter is guaranteed but not production tested.
3. The bus switch contributes no propagation delay other than the RC delay of the ON resistance of the switch and the load capacitance. The time constant for the switch alone is of the order of 0.25ns for C_L = 50pF. Since this time constant is much smaller than the rise and fall times of typical driving signals, it adds very little propagation delay to the system. Propagation delay of the bus switch, when used in a system, is determined by the driving circuit on the driving side of the switch and its interaction with the load on the driven side.
