Functional Block Diagram

General Description

The AH322 is a high dynamic range driver amplifier in a low-cost surface-mount package. The InGaP/GaAs HBT is able to achieve high performance for various narrowband-tuned application circuits with up to +50 dBm OIP3 and +33 dBm of compressed 1dB power. The integrated active bias circuitry in the devices enables excellent stable linearity performance over temperature. It is housed in a lead-free/RoHS-compliant SOIC-8 package. All devices are 100% RF and DC tested.

The AH322 is targeted for use as a driver amplifier in wireless infrastructure where high linearity and medium power is required. The AH322 is ideal for the final stage of small repeaters or as driver stages for high power amplifiers. In addition, the amplifier can be used for a wide variety of other applications within the 400 to 2700 MHz frequency band.

Device Characterization Data

Note: The gain for the unmatched device in 50 ohm system is shown as the trace in pink color, [DB (S (2, 1))]. For a tuned circuit for a particular frequency, it is expected that actual gain will be higher, up to the maximum stable gain. The maximum stable gain is shown in the blue line [DB (GMAX)]. The impedance plots are shown from 0.05 – 3 GHz.

Application Board Information

PC Board Layout

Top RF layer is .014" Getek, $\epsilon_r = 4.0$, 4 total layers (0.062" thick) for mechanical rigidity. Metal layers are 1-oz copper. Microstrip line details: width = .030", spacing = .026".

The silk screen markers 'A', 'B', 'C', etc. and '1', '2', '3', etc. are used as placemarkers for the input and output tuning shunt capacitors – C8, C5 and C2. The markers and vias are spaced in .050" increments.

The pad pattern shown has been developed and tested for optimized assembly at TriQuint Semiconductor. The PCB land pattern has been developed to accommodate lead and package tolerances. Since surface mount processes vary from company to company, careful process development is recommended.

Package Information and Dimensions

This package is lead-free/RoHS-compliant. The plating material on the leads is NiPdAu. It is compatible with both lead-free (maximum 260 °C reflow temperature) and lead (maximum 245 °C reflow temperature) soldering processes.

The AH225 will be marked with an “AH322G” designator with a lot code marked below the part designator. The “Y” represents the last digit of the year the part was manufactured, the “XXXX” is an auto-generated number, and “Z” refers to a wafer number in a lot batch.

Mounting Configuration

Notes:

- A heat sink underneath the area of the PCB for the mounted device is strictly required for proper thermal operation. Damage to the device can occur without the use of one.
- Ground / thermal vias are critical for the proper performance of this device. Vias should use a .35mm (#80 / .0135") diameter drill and have a final plated thru diameter of .25 mm (.010") or equivalent.
- Add as much copper as possible to inner and outer layers near the part to ensure optimal thermal performance.
- Mounting screws can be added near the part to fasten the board to a heat sink. Ensure that the ground / thermal via region contact the heat sink.
- Do not put solder mask on the backside of the PC board in the region where the board contacts the heat sink.
- RF Trace width depends upon the PC board material and construction.
- Use 1 oz. Copper minimum.
- All dimensions are in millimeters (inches). Angles are in degrees.
