

Features

- Operating voltage: 2.5V~5.5V
- Serial mode for the HT9200A
- Serial/parallel mode for the HT9200B
- Low standby current
- Low total harmonic distortion
- 3.58MHz crystal or ceramic resonator
- HT9200A: 8-pin DIP/SOP package
- HT9200B: 14-pin SOP package

General Description

The HT9200A/B tone generators are designed for MCU interfaces. They can be instructed by a MCU to generate 16 dual tones and 8 single tones from the DTMF pin. The HT9200A provides a serial mode whereas the

HT9200B contains a selectable serial/parallel mode interface for various applications such as security systems, home automation, remote control through telephone lines, communication systems, etc.

Functional Description

The HT9200A/B are DTMF generators for MCU interfaces. They are controlled by a MCU in the serial mode or the parallel mode (for the HT9200B only).

Serial Mode (HT9200A/B)

The HT9200A/B employ a data input, a 5-bit code, and a synchronous clock to transmit a DTMF signal. Every digit of a phone number to be transmitted is selected by a series of inputs which consist of 5-bit data. Of the 5

bits, the D0(LSB) is the first received bit. The HT9200A/B will latch data on the falling edge of the clock (CLK pin). The relationship between the digital codes and the tone output frequency is shown in Table 1. As for the control timing diagram, refer to Figure 1.

When the system is operating in the serial mode a pull-high resistor is attached to D0~D3 (for parallel mode) on the input terminal.

—	1	0	1	1	1	1633
DTMF OFF	1	1	1	1	1	—

Note: The codes not listed in Table 1 are not used D4 is MSB

For the HT9200B, the $\overline{S/P}$ pin has to be connected low for serial mode operation.

Parallel Mode (HT9200B)

The HT9200B provides four data inputs D0~D3 to generate their corresponding DTMF signals. The $\overline{S/P}$ has to be connected high to select the parallel operation mode. Then the input data codes should be determined. Finally, the $\overline{CE}$ is connected low to transmit the DTMF signal from the DTMF pin.

The T_{DE} time (about 6ms) will be delayed from the $\overline{CE}$ falling edge to the DTMF signal output.

The relationship between the digital codes and the tone output frequency is illustrated in Table 2. As for the control timing diagram, see Figure 2.

When the system is operating in the parallel mode, D0~D3 are all in the floating state. Thus, these data input pins should not float.
