

Dear customers,

**About the change in the name such as "Oki Electric Industry Co. Ltd." and "OKI" in documents to OKI Semiconductor Co., Ltd.**

The semiconductor business of Oki Electric Industry Co., Ltd. was succeeded to OKI Semiconductor Co., Ltd. on October 1, 2008. Therefore, please accept that although the terms and marks of "Oki Electric Industry Co., Ltd.", "Oki Electric", and "OKI" remain in the documents, they all have been changed to "OKI Semiconductor Co., Ltd.". It is a change of the company name, the company trademark, and the logo, etc. , and NOT a content change in documents.

October 1, 2008  
OKI Semiconductor Co., Ltd.

**OKI Semiconductor****MSM51V16800D/DSL****2,097,152-Word × 8-Bit DYNAMIC RAM : FAST PAGE MODE TYPE****DESCRIPTION**

The MSM51V16800D/DSL is a 2,097,152-word × 8-bit dynamic RAM fabricated in Oki's silicon-gate CMOS technology. The MSM51V16800D/DSL achieves high integration, high-speed operation, and low-power consumption because Oki manufactures the device in a quadruple-layer polysilicon/double-layer metal CMOS process. The MSM51V16800D/DSL is available in a 28-pin plastic SOJ or 28-pin plastic TSOP. The MSM51V16800DSL (the self-refresh version) is specially designed for lower-power applications.

**FEATURES**

- 2,097,152-word × 8-bit configuration
- Single 3.3 V power supply, ±0.3 V tolerance
- Input : LVTTTL compatible, low input capacitance
- Output : LVTTTL compatible, 3-state
- Refresh : 4096 cycles/64 ms, 4096 cycles/128 ms (SL version)
- Fast page mode, read modify write capability
- $\overline{\text{CAS}}$  before  $\overline{\text{RAS}}$  refresh, hidden refresh,  $\overline{\text{RAS}}$ -only refresh capability
- $\overline{\text{CAS}}$  before  $\overline{\text{RAS}}$  self-refresh capability (SL version)
- Multi-bit test mode capability
- Package options:
 

|                             |                         |                                     |
|-----------------------------|-------------------------|-------------------------------------|
| 28-pin 400 mil plastic SOJ  | (SOJ28-P-400-1.27)      | (Product : MSM51V16800D/DSL-xxJS)   |
| 28-pin 400 mil plastic TSOP | (TSOP1128-P-400-1.27-K) | (Product : MSM51V16800D/DSL-xxTS-K) |

 xx indicates speed rank.

# PIN CONFIGURATION (TOP VIEW)

| Pin Name               | Function               |
|------------------------|------------------------|
| A0 - A8,<br>A9R - A11R | Address Input          |
| RAS                    | Row Address Strobe     |
| CAS                    | Column Address Strobe  |
| DQ1 - DQ8              | Data Input/Data Output |
| OE                     | Output Enable          |
| WE                     | Write Enable           |
| V <sub>CC</sub>        | Power Supply (3.3 V)   |
| V <sub>SS</sub>        | Ground (0 V)           |

Note : The same power supply voltage must be provided to every V<sub>CC</sub> pin, and the same GND voltage level must be provided to every V<sub>SS</sub> pin.

## BLOCK DIAGRAM

## ELECTRICAL CHARACTERISTICS

### Absolute Maximum Ratings

| Parameter                               | Symbol    | Rating      | Unit |
|-----------------------------------------|-----------|-------------|------|
| Voltage on Any Pin Relative to $V_{SS}$ | $V_T$     | -0.5 to 4.6 | V    |
| Short Circuit Output Current            | $I_{OS}$  | 50          | mA   |
| Power Dissipation                       | $P_D^*$   | 1           | W    |
| Operating Temperature                   | $T_{opr}$ | 0 to 70     | °C   |
| Storage Temperature                     | $T_{stg}$ | -55 to 150  | °C   |

\*:  $T_a = 25^\circ\text{C}$

### Recommended Operating Conditions

( $T_a = 0^\circ\text{C}$  to  $70^\circ\text{C}$ )

| Parameter            | Symbol   | Min. | Typ. | Max.           | Unit |
|----------------------|----------|------|------|----------------|------|
| Power Supply Voltage | $V_{CC}$ | 3.0  | 3.3  | 3.6            | V    |
|                      | $V_{SS}$ | 0    | 0    | 0              | V    |
| Input High Voltage   | $V_{IH}$ | 2.0  | —    | $V_{CC} + 0.3$ | V    |
| Input Low Voltage    | $V_{IL}$ | -0.3 | —    | 0.8            | V    |

### Capacitance

( $V_{CC} = 3.3\text{ V} \pm 0.3\text{ V}$ ,  $T_a = 25^\circ\text{C}$ ,  $f = 1\text{ MHz}$ )

| Parameter                                                                                                                 | Symbol    | Typ. | Max. | Unit |
|---------------------------------------------------------------------------------------------------------------------------|-----------|------|------|------|
| Input Capacitance<br>(A0 - A8, A9R - A11R)                                                                                | $C_{IN1}$ | —    | 5    | pF   |
| Input Capacitance ( $\overline{\text{RAS}}$ , $\overline{\text{CAS}}$ , $\overline{\text{WE}}$ , $\overline{\text{OE}}$ ) | $C_{IN2}$ | —    | 7    | pF   |
| Output Capacitance (DQ1 - DQ8)                                                                                            | $C_{I/O}$ | —    | 7    | pF   |

- Notes :
1. I<sub>CC</sub> Max. is specified as I<sub>CC</sub> for output open condition.
  2. The address can be changed once or less while  $\overline{\text{RAS}}$  = V<sub>IL</sub>.
  3. The address can be changed once or less while  $\overline{\text{CAS}}$  = V<sub>IH</sub>.
  4. V<sub>CC</sub> - 0.2 V ≤ V<sub>IH</sub> ≤ V<sub>CC</sub> + 0.3 V, -0.3 V ≤ V<sub>IL</sub> ≤ 0.2 V.
  5. SL version.

## AC Characteristics (1/2)

- Notes:
1. A start-up delay of 200  $\mu$ s is required after power-up, followed by a minimum of eight initialization cycles ( $\overline{\text{RAS}}$ -only refresh or  $\overline{\text{CAS}}$  before  $\overline{\text{RAS}}$  refresh) before proper device operation is achieved.
  2. The AC characteristics assume  $t_T = 5$  ns.
  3.  $V_{IH}$  (Min.) and  $V_{IL}$  (Max.) are reference levels for measuring input timing signals. Transition times ( $t_T$ ) are measured between  $V_{IH}$  and  $V_{IL}$ .
  4. This parameter is measured with a load circuit equivalent to 1 TTL load and 100 pF. The output timing reference levels are  $V_{OH} = 2.0$  V and  $V_{OL} = 0.8$  V.
  5. Operation within the  $t_{RCD}$  (Max.) limit ensures that  $t_{RAC}$  (Max.) can be met.  $t_{RCD}$  (Max.) is specified as a reference point only. If  $t_{RCD}$  is greater than the specified  $t_{RCD}$  (Max.) limit, then the access time is controlled by  $t_{CAC}$ .
  6. Operation within the  $t_{RAD}$  (Max.) limit ensures that  $t_{RAC}$  (Max.) can be met.  $t_{RAD}$  (Max.) is specified as a reference point only. If  $t_{RAD}$  is greater than the specified  $t_{RAD}$  (Max.) limit, then the access time is controlled by  $t_{AA}$ .
  7.  $t_{OFF}$  (Max.) and  $t_{OEZ}$  (Max.) define the time at which the output achieves the open circuit condition and are not referenced to output voltage levels.
  8.  $t_{RCH}$  or  $t_{RRH}$  must be satisfied for a read cycle.
  9.  $t_{WCS}$ ,  $t_{CWD}$ ,  $t_{RWD}$ ,  $t_{AWD}$  and  $t_{CPWD}$  are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only. If  $t_{WCS} \geq t_{WCS}$  (Min.), then the cycle is an early write cycle and the data out will remain open circuit (high impedance) throughout the entire cycle. If  $t_{CWD} \geq t_{CWD}$  (Min.),  $t_{RWD} \geq t_{RWD}$  (Min.),  $t_{AWD} \geq t_{AWD}$  (Min.) and  $t_{CPWD} \geq t_{CPWD}$  (Min.), then the cycle is a read modify write cycle and data out will contain data read from the selected cell; if neither of the above sets of conditions is satisfied, then the condition of the data out (at access time) is indeterminate.
  10. These parameters are referenced to the  $\overline{\text{CAS}}$  leading edge in an early write cycle, and to the  $\overline{\text{WE}}$  leading edge in an  $\overline{\text{OE}}$  control write cycle, or a read modify write cycle.
  11. The test mode is initiated by performing a  $\overline{\text{WE}}$  and  $\overline{\text{CAS}}$  before  $\overline{\text{RAS}}$  refresh cycle. This mode is latched and remains in effect until the exit cycle is generated. The test mode specified in this data sheet is a 2-bit parallel test function. CA8 is not used. In a read cycle, if all internal bits are equal, the DQ pin will indicate a high level. If any internal bits are not equal, the DQ pin will indicate a low level. The test mode is cleared and the memory device returned to its normal operating state by performing a  $\overline{\text{RAS}}$ -only refresh cycle or a  $\overline{\text{CAS}}$  before  $\overline{\text{RAS}}$  refresh cycle.
  12. In a test mode read cycle, the value of access time parameters is delayed for 5 ns for the specified value. These parameters should be specified in test mode cycle by adding the above value to the specified value in this data sheet.
  13. Only SL version.

## TIMING WAVEFORM

## Read Cycle

## Write Cycle (Early Write)

# Read Modify Write Cycle

[illegible]

The diagram illustrates the timing relationships for a memory device. The signals shown are  $\overline{\text{RAS}}$ ,  $\overline{\text{CAS}}$ , Address, and DQ. The timing parameters are defined as follows:

- $t_{\text{RC}}$ : Total refresh period from the start of  $\overline{\text{RAS}}$  to the start of the next  $\overline{\text{RAS}}$ .
- $t_{\text{RAS}}$ : Row access time from the start of  $\overline{\text{RAS}}$  to the start of data output.
- $t_{\text{RP}}$ : Row period from the start of  $\overline{\text{RAS}}$  to the start of the next  $\overline{\text{RAS}}$ .
- $t_{\text{CRP}}$ : Column refresh period from the start of  $\overline{\text{CAS}}$  to the start of the next  $\overline{\text{CAS}}$ .
- $t_{\text{RPC}}$ : Row period from the start of  $\overline{\text{CAS}}$  to the start of the next  $\overline{\text{CAS}}$ .
- $t_{\text{ASR}}$ : Address setup time from the start of  $\overline{\text{CAS}}$  to the start of data output.
- $t_{\text{RAH}}$ : Address hold time from the start of data output to the start of the next  $\overline{\text{CAS}}$ .
- $t_{\text{OFF}}$ : Output delay time from the start of data output to the start of the next  $\overline{\text{CAS}}$ .

The diagram also shows the data output (DQ) signal, which is high ( $V_{\text{OH}}$ ) or low ( $V_{\text{OL}}$ ) during the access time, and then goes to an "Open" state. The Address signal is shown as a bus with a "Row" selected, indicated by a shaded area.

## Notes for Mounting the Surface Mount Type Package

The SOP, QFP, TSOP, SOJ, QFJ (PLCC), SHP and BGA are surface mount type packages, which are very susceptible to heat in reflow mounting and humidity absorbed in storage.

Therefore, before you perform reflow mounting, contact Oki's responsible sales person for the product name, package name, pin number, package code and desired mounting conditions (reflow method, temperature and times).
