- *1: I_{S1} is specified at the 5% drop point of output voltage V_o on the condition that $V_{\text{IN}} = 3.3 \text{ V}$ (5 V for SI-3033LSA), and $I_o = 0.5 \text{ A}$.
*2: Output is OFF when the output control terminal V_c is open. Each input level is equivalent to LS-TTL level. Therefore, the device can be driven directly by LS-TTLs.
*3: These products cannot be used in the following applications. Because these applications require a certain current at start-up and so the built-in foldback-type overcurrent protection may cause errors during start-up stage.
(1) Constant current load (2) Positive and negative power supply (3) Series-connected power supply (4) V_o adjustment by raising ground voltage

Block Diagram

Typical Connection Diagram

 C_O : Output capacitor (22 μ F or larger) C_{IN} : Input capacitor (10 μ F)

This capacitor is required in the case of an inductive input line or long wiring.

Tantalum capacitors are recommended for C_{IN} and C_O , particularly at low temperatures.

* Leave pin 2 open.

Reference Data

PCB Copper Laminate Area vs. Junction to Ambient Air Thermal Resistance

Allowable Output Current (vs. $V_{IN}-V_{OUT}$ Voltage Difference)
 $V_{IN}-I_O$ max

The inner frame stage, on which the PTR is mounted, is directly connected to the V_{OUT} pin. Therefore, enlarging the copper laminate area around the V_{OUT} pin is really effective for a heat radiation.
