

MCP14A0051/2

0.5A MOSFET Driver With Low Threshold Input And Enable

Features

- · High Peak Output Current: 0.5A (typical)
- Wide Input Supply Voltage Operating Range:
 - 4.5V to 18V
- Low Shoot-Through/Cross-Conduction Current in Output Stage
- · High Capacitive Load Drive Capability:
 - 1000 pF in 40 ns (typical)
- Short Delay Times: 33 ns (t_{D1}), 24 ns (t_{D2}) (typical)
- Low Supply Current: 375 μA (typical)
- Low Voltage Threshold Input and Enable with Hysteresis
- Latch-Up Protected: Withstands 500 mA Reverse Current
- · Space-Saving Packages:
 - 6L SOT-23
 - 6L2x2DFN

Applications

- · Switch Mode Power Supplies
- · Pulse Transformer Drive
- Line Drivers
- Level Translator
- Motor and Solenoid Drive

General Description

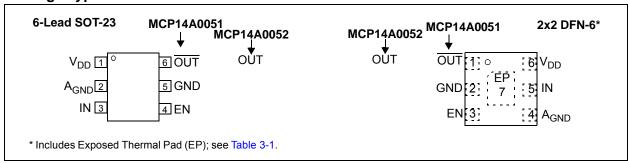

The MCP14A0051/2 devices are high-speed MOSFET drivers that are capable of providing up to 0.5A of peak current while operating from a single 4.5V to 18V supply. The inverting (MCP14A0051) or non-inverting (MCP14A0052) single-channel output is directly controlled from either TTL or CMOS (2V to 18V) logic. These devices also feature low shoot-through current, matched rise and fall times, and short propagation delays which make them ideal for high switching frequency applications.

The MCP14A0051/2 family of devices offer enhanced control with Enable functionality. The active-high Enable pin can be driven low to drive the output of the MCP14A0051/2 low regardless of the status of the Input pin. An integrated pull-up resistor allows the user to leave the Enable pin floating for standard operation.

Additionally, the MCP14A0051/2 devices feature separate ground pins (A_{GND} and GND), allowing greater noise isolation between the level-sensitive Input/ Enable pins and the fast, high-current transitions of the push-pull output stage.

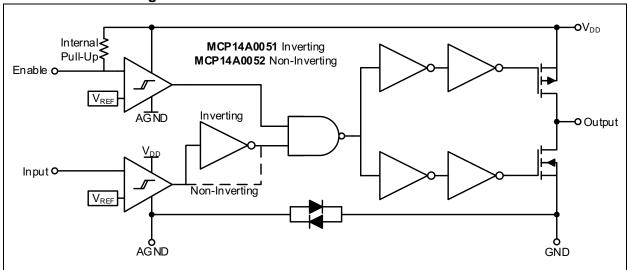

These devices are highly latch-up resistant under any condition within their power and voltage ratings. They can accept up to 500 mA of reverse current being forced back into their outputs without damage or logic upset. All terminals are fully protected against electrostatic discharge (ESD) up to 1.75 kV (HBM) and 100V (MM).

Package Types

3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in Table 3-1.

TABLE 3-1: PIN FUNCTION TABLE

Pin	No.	Symbol	Description
6L 2x2 DFN	6L SOT-23	Symbol	Description
1	6	OUT/OUT	Push-Pull Output
2	5	GND	Power Ground
3	4	EN	Device Enable
4	2	A _{GND}	Analog Ground
5	3	IN Control Input	
6	1	V_{DD}	Supply Input
EP	_	EP	Exposed Thermal Pad (GND)

3.1 Output Pin (OUT, OUT)

The Output is a CMOS push-pull output that is capable of sourcing and sinking 0.5A of peak current (V_{DD} = 18V). The low output impedance ensures the gate of the external MOSFET stays in the intended state even during large transients. This output also has a reverse current latch-up rating of 500 mA.

3.2 Power Ground Pin (GND)

GND is the device return pin for the output stage. The GND pin should have a low-impedance connection to the bias supply source return. When the capacitive load is being discharged, high peak currents will flow out of the ground pin.

3.3 Device Enable Pin (EN)

The MOSFET driver Device Enable is a high-impedance, TTL/CMOS compatible input. The Enable input also has hysteresis between the high and low-input levels, allowing them to be driven from slow rising and falling signals and to provide noise immunity. Driving the Enable pin below the threshold will disable the output of the device, pulling \overline{OUT}/OUT low, regardless of the status of the Input pin. Driving the Enable pin above the threshold allows normal operation of the \overline{OUT}/OUT pin based on the status of the Input pin. The Enable pin utilizes an internal pull up resistor, allowing the pin to be left floating for standard driver operation.

3.4 Analog Ground Pin (A_{GND})

AGND is the device return pin for the input and enable stages of the MOSFET driver. The AGND pin should be connected to an electrically "quiet" ground node to provide a low noise reference for the input and enable pins.

3.5 Control Input Pin (IN)

The MOSFET driver Control Input is a high-impedance, TTL/CMOS compatible input. The Input also has hysteresis between the high and low-input levels, allowing them to be driven from slow rising and falling signals and to provide noise immunity.

3.6 Supply Input Pin (V_{DD})

 V_{DD} is the bias supply input for the MOSFET driver and has a voltage range of 4.5V to 18V. This input must be decoupled to ground with a local capacitor. This bypass capacitor provides a localized low-impedance path for the peak currents that are provided to the load.

3.7 Exposed Metal Pad Pin (EP)

The exposed metal pad of the DFN package is not internally connected to any potential. Therefore, this pad can be connected to a ground plane, or other copper plane on a printed circuit board, to aid in heat removal from the package.

4.0 APPLICATION INFORMATION

4.1 General Information

MOSFET drivers are high-speed, high-current devices which are intended to source/sink high peak currents to charge/discharge the gate capacitance of external MOSFETs or Insulated-Gate Bipolar Transistors (IGBTs). In high-frequency switching power supplies, the Pulse-Width Modulation (PWM) controller may not have the drive capability to directly drive the power MOSFET. A MOSFET driver such as the MCP14A0051/2 family can be used to provide additional source/sink current capability.

4.2 MOSFET Driver Timing

The ability of a MOSFET driver to transition from a fully-off state to a fully-on state is characterized by the driver's rise time (t_R), fall time (t_F) and propagation delays (t_{D1} and t_{D2}). Figure 4-1 and Figure 4-2 show the test circuit and timing waveform used to verify the MCP14A0051/2 timing.

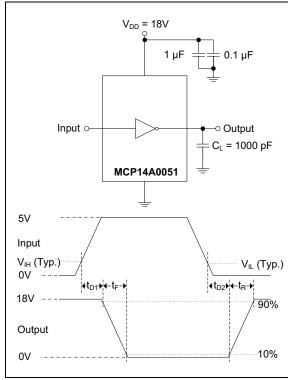

FIGURE 4-1: Inverting Driver Timing Waveform.

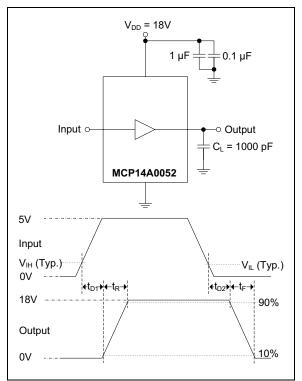

FIGURE 4-2: Non-Inverting Driver Timing Waveform.

4.3 Enable Function

The enable pin (EN) provides additional control of the output pin (OUT). This pin is active high and is internally pulled up to V_{DD} so that the pin can be left floating to provide standard MOSFET driver operation.

When the enable pin's voltage is above the Enable pin high-voltage threshold, (V_{EN_H}) , the output is enabled and allowed to react to the status of the Input pin. However, when the voltage applied to the Enable pin falls below the low threshold voltage (V_{EN_L}) , the driver output is disabled and doesn't respond to changes in the status of the Input pin. When the driver is disabled, the output is pulled down to a low state. Refer to Table 4-1 for enable pin logic. The threshold voltage levels for the Enable pin are similar to the threshold voltage levels of the Input pin, and are TTL and CMOS compatible. Hysteresis is provided to help increase the noise immunity of the enable function, avoiding false triggers of the enable signal during driver switching.

There are propagation delays associated with the driver receiving an enable signal and the output reacting. These propagation delays, t_{D3} and t_{D4} , are graphically represented in Figure 4-3.

TABLE 4-1: ENABLE PIN LOGIC

ENB	IN	MCP <u>14A</u> 0051 OUT	MCP14A0052 OUT
Н	Н	L	Н
Н	L	Н	L
L	Х	L	L

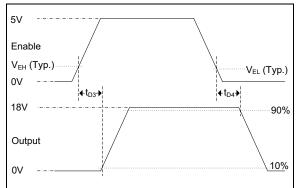

FIGURE 4-3: Enable Timing Waveform.

4.4 **Decoupling Capacitors**

Careful PCB layout and decoupling capacitors are required when using power MOSFET drivers. Large current is required to charge and discharge capacitive loads quickly. For example, approximately 720 mA are needed to charge a 1000 pF load with 18V in 25 ns.

To operate the MOSFET driver over a wide frequency range with low supply impedance, it is recommended to place 1.0 μF and 0.1 μF low ESR ceramic capacitors in parallel between the driver V_{DD} and GND. These capacitors should be placed close to the driver to minimize circuit board parasitics and provide a local source for the required current.

4.5 **PCB Layout Considerations**

Proper Printed Circuit Board (PCB) layout is important in high-current, fast switching circuits to provide proper device operation and robustness of design. Improper component placement may cause errant switching, excessive voltage ringing or circuit latch-up. The PCB trace loop length and inductance should be minimized by the use of ground planes or traces under the MOSFET gate drive signal, separate analog and power grounds, and local driver decoupling.

Placing a ground plane beneath the MCP14A0051/2 devices will help as a radiated noise shield, as well as providing some heat sinking for power dissipated within the device.

4.6 **Power Dissipation**

The total internal power dissipation in a MOSFET driver is the summation of three separate power dissipation elements, as shown in Equation 4-1.

EQUATION 4-1:

 $P_T = P_L + P_Q + P_{CC}$

Where:

 P_T = Total power dissipation P_I = Load power dissipation Quiescent power dissipation

 P_{CC} Operating power dissipation

4.6.1 CAPACITIVE LOAD DISSIPATION

The power dissipation caused by a capacitive load is a direct function of the frequency, total capacitive load and supply voltage. The power lost in the MOSFET driver for a complete charging and discharging cycle of a MOSFET is shown in Equation 4-2.

EQUATION 4-2:

 $P_L = f \times C_T \times V_{DD}^2$

Where:

Switching frequency

Total load capacitance

MOSFET driver supply voltage V^{DD}

4.6.2 QUIESCENT POWER DISSIPATION

The power dissipation associated with the quiescent current draw depends on the state of the Input and Enable pins. Refer to Section 1.0 "Electrical Characteristics" for typical quiescent current draw values in different operating states. The quiescent power dissipation is shown in Equation 4-3.

EQUATION 4-3:

 $P_{Q} = (I_{QH} \times D + I_{QL} \times (1 - D)) \times V_{DD}$ Where:

Quiescent current in the High state I_{QH}

D Duty cycle

Quiescent current in the Low state I_{QL}

MOSFET driver supply voltage V_{DD}

MCP14A0051/2

4.6.3 OPERATING POWER DISSIPATION

The operating power dissipation occurs each time the MOSFET driver output transitions because, for a very short period of time, both MOSFETs in the output stage are on simultaneously. This cross-conduction current leads to a power dissipation described in Equation 4-4.

EQUATION 4-4:

 $P_{CC} = CC \times f \times V_{DD}$

Where:

CC = Cross-Conduction constant

(Ampere x second)

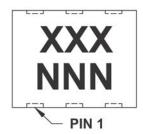

f = Switching frequency

 V_{DD} = MOSFET driver supply voltage

5.0 PACKAGING INFORMATION

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

PART NO. [XI⁽¹⁾ -X /XX |
Device Tape and Reel Temperature Package Range

Device: MCP14A0051T: High-Speed MOSFET Driver

(Tape and Reel)

MCP14A0052T: High-Speed MOSFET Driver

(Tape and Reel)

Temperature Range: E = -40°C to +125°C (Extended)

Package: CH = Plastic Small Outline Transistor (SOT-23), 6-lead

AY = Plastic Dual Flat, No Lead Package -

2 x 2 x 0.9 mm Body (DFN) 6-lead

Examples:

a) MCP14A0051T-E/CH: Tape and Reel,

Extended temperature, 6LD SOT-23 package

a) MCP14A0052T-E/MAY:Tape and Reel

Extended temperature, 6LD DFN package

Note 1:

Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package. Check with your Microchip Sales Office for package availability with the Tape and Reel option.

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

Trademarks

The Microchip name and logo, the Microchip logo, dsPIC, FlashFlex, flexPWR, JukeBlox, KEELoQ, KEELoQ logo, Kleer, LANCheck, MediaLB, MOST, MOST logo, MPLAB, OptoLyzer, PIC, PICSTART, PIC³² logo, RightTouch, SpyNIC, SST, SST Logo, SuperFlash and UNI/O are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

The Embedded Control Solutions Company and mTouch are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Analog-for-the-Digital Age, BodyCom, chipKIT, chipKIT logo, CodeGuard, dsPICDEM, dsPICDEM.net, ECAN, In-Circuit Serial Programming, ICSP, Inter-Chip Connectivity, KleerNet, KleerNet logo, MiWi, MPASM, MPF, MPLAB Certified logo, MPLIB, MPLINK, MultiTRAK, NetDetach, Omniscient Code Generation, PICDEM, PICDEM.net, PICkit, PICtail, RightTouch logo, REAL ICE, SQI, Serial Quad I/O, Total Endurance, TSHARC, USBCheck, VariSense, ViewSpan, WiperLock, Wireless DNA, and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

 $\ensuremath{\mathsf{SQTP}}$ is a service mark of Microchip Technology Incorporated in the U.S.A.

Silicon Storage Technology is a registered trademark of Microchip Technology Inc. in other countries.

GestIC is a registered trademarks of Microchip Technology Germany II GmbH & Co. KG, a subsidiary of Microchip Technology Inc., in other countries.

QUALITY MANAGEMENT SYSTEM CERTIFIED BY DNV = ISO/TS 16949=

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
