Features

- High-performance, Low-power Atmel[®] AVR[®] 8-bit Microcontroller
- Advanced RISC Architecture
 - 131 Powerful Instructions Most Single-clock Cycle Execution
 - 32 x 8 General Purpose Working Registers
 - Fully Static Operation
 - Up to 16 MIPS Throughput at 16 MHz
 - On-chip 2-cycle Multiplier
- High Endurance Non-volatile Memory segments
 - 16 Kbytes of In-System Self-programmable Flash program memory
 - 512 Bytes EEPROM
 - 1 Kbyte Internal SRAM
 - Write/Erase Cycles: 10,000 Flash/100,000 EEPROM
 - Data retention: 20 years at 85°C/100 years at 25°C(1)
 - Optional Boot Code Section with Independent Lock Bits In-System Programming by On-chip Boot Program True Read-While-Write Operation
 - Programming Lock for Software Security
- JTAG (IEEE std. 1149.1 Compliant) Interface
 - Boundary-scan Capabilities According to the JTAG Standard
 - Extensive On-chip Debug Support
 - Programming of Flash, EEPROM, Fuses, and Lock Bits through the JTAG Interface
- Peripheral Features
 - Two 8-bit Timer/Counters with Separate Prescalers and Compare Modes
 - One 16-bit Timer/Counter with Separate Prescaler, Compare Mode, and Capture Mode
 - Real Time Counter with Separate Oscillator
 - Four PWM Channels
 - 8-channel, 10-bit ADC
 - 8 Single-ended Channels
 - 7 Differential Channels in TQFP Package Only
 - 2 Differential Channels with Programmable Gain at 1x, 10x, or 200x
 - Byte-oriented Two-wire Serial Interface
 - Programmable Serial USART
 - Master/Slave SPI Serial Interface
 - Programmable Watchdog Timer with Separate On-chip Oscillator
 - On-chip Analog Comparator
- Special Microcontroller Features
 - Power-on Reset and Programmable Brown-out Detection
 - Internal Calibrated RC Oscillator
 - External and Internal Interrupt Sources
 - Six Sleep Modes: Idle, ADC Noise Reduction, Power-save, Power-down, Standby and Extended Standby
- I/O and Packages
 - 32 Programmable I/O Lines
 - 40-pin PDIP, 44-lead TQFP, and 44-pad QFN/MLF
- Operating Voltages
 - 2.7V 5.5V for ATmega16L
 - 4.5V 5.5V for ATmega16
- Speed Grades
 - 0 8 MHz for ATmega16L
 - 0 16 MHz for ATmega16
- Power Consumption @ 1 MHz, 3V, and 25°C for ATmega16L
 - Active: 1.1 mA
 - Idle Mode: 0.35 mA
 - Power-down Mode: < 1 μA

Disclaimer

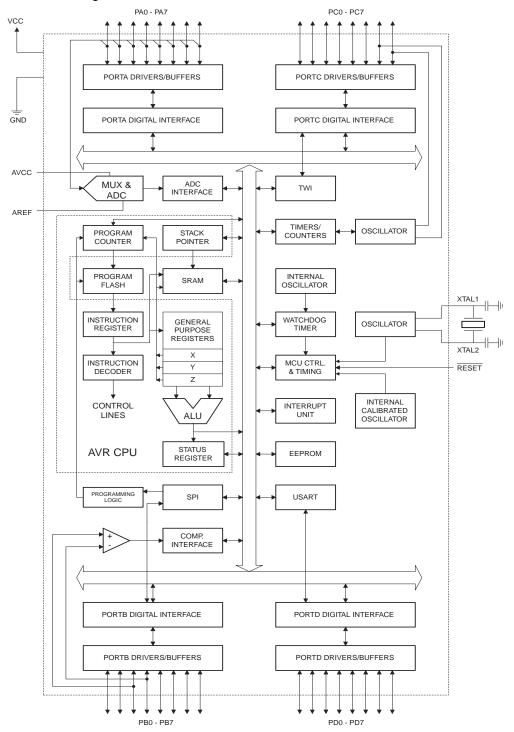

Typical values contained in this datasheet are based on simulations and characterization of other AVR microcontrollers manufactured on the same process technology. Min and Max values will be available after the device is characterized.

Overview

The ATmega16 is a low-power CMOS 8-bit microcontroller based on the AVR enhanced RISC architecture. By executing powerful instructions in a single clock cycle, the ATmega16 achieves throughputs approaching 1 MIPS per MHz allowing the system designer to optimize power consumption versus processing speed.

Block Diagram

Figure 2. Block Diagram

The AVR core combines a rich instruction set with 32 general purpose working registers. All the 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

The ATmega16 provides the following features: 16 Kbytes of In-System Programmable Flash Program memory with Read-While-Write capabilities, 512 bytes EEPROM, 1 Kbyte SRAM, 32 general purpose I/O lines, 32 general purpose working registers, a JTAG interface for Boundaryscan, On-chip Debugging support and programming, three flexible Timer/Counters with compare modes, Internal and External Interrupts, a serial programmable USART, a byte oriented Two-wire Serial Interface, an 8-channel, 10-bit ADC with optional differential input stage with programmable gain (TQFP package only), a programmable Watchdog Timer with Internal Oscillator, an SPI serial port, and six software selectable power saving modes. The Idle mode stops the CPU while allowing the USART, Two-wire interface, A/D Converter, SRAM, Timer/Counters, SPI port, and interrupt system to continue functioning. The Power-down mode saves the register contents but freezes the Oscillator, disabling all other chip functions until the next External Interrupt or Hardware Reset. In Power-save mode, the Asynchronous Timer continues to run, allowing the user to maintain a timer base while the rest of the device is sleeping. The ADC Noise Reduction mode stops the CPU and all I/O modules except Asynchronous Timer and ADC, to minimize switching noise during ADC conversions. In Standby mode, the crystal/resonator Oscillator is running while the rest of the device is sleeping. This allows very fast start-up combined with low-power consumption. In Extended Standby mode, both the main Oscillator and the Asynchronous Timer continue to run.

The device is manufactured using Atmel's high density nonvolatile memory technology. The Onchip ISP Flash allows the program memory to be reprogrammed in-system through an SPI serial interface, by a conventional nonvolatile memory programmer, or by an On-chip Boot program running on the AVR core. The boot program can use any interface to download the application program in the Application Flash memory. Software in the Boot Flash section will continue to run while the Application Flash section is updated, providing true Read-While-Write operation. By combining an 8-bit RISC CPU with In-System Self-Programmable Flash on a monolithic chip, the Atmel ATmega16 is a powerful microcontroller that provides a highly-flexible and cost-effective solution to many embedded control applications.

The ATmega16 AVR is supported with a full suite of program and system development tools including: C compilers, macro assemblers, program debugger/simulators, in-circuit emulators, and evaluation kits.

Pin Descriptions

VCC Digital supply voltage.

GND Ground.

Port A (PA7..PA0) Port A serves as the analog inputs to the A/D Converter.

Port A also serves as an 8-bit bi-directional I/O port, if the A/D Converter is not used. Port pins can provide internal pull-up resistors (selected for each bit). The Port A output buffers have symmetrical drive characteristics with both high sink and source capability. When pins PA0 to PA7 are used as inputs and are externally pulled low, they will source current if the internal pull-up resistors are activated. The Port A pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port B (PB7..PB0)

Port B is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port B output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port B pins that are externally pulled low will source current if the pull-up resistors are activated. The Port B pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port B also serves the functions of various special features of the ATmega16 as listed on page 58.

Port C (PC7..PC0)

Port C is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port C output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port C pins that are externally pulled low will source current if the pull-up resistors are activated. The Port C pins are tri-stated when a reset condition becomes active, even if the clock is not running. If the JTAG interface is enabled, the pull-up resistors on pins PC5(TDI), PC3(TMS) and PC2(TCK) will be activated even if a reset occurs.

Port C also serves the functions of the JTAG interface and other special features of the ATmega16 as listed on page 61.

Port D (PD7..PD0)

Port D is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port D output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port D pins that are externally pulled low will source current if the pull-up resistors are activated. The Port D pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port D also serves the functions of various special features of the ATmega16 as listed on page 63.

RESET

Reset Input. A low level on this pin for longer than the minimum pulse length will generate a reset, even if the clock is not running. The minimum pulse length is given in Table 15 on page 38. Shorter pulses are not guaranteed to generate a reset.

XTAL1

Input to the inverting Oscillator amplifier and input to the internal clock operating circuit.

XTAL2

Output from the inverting Oscillator amplifier.

AVCC

AVCC is the supply voltage pin for Port A and the A/D Converter. It should be externally connected to V_{CC} , even if the ADC is not used. If the ADC is used, it should be connected to V_{CC} through a low-pass filter.

AREF

AREF is the analog reference pin for the A/D Converter.

A comprehensive set of development tools, application notes and datasheets are available for download on http://www.atmel.com/avr.

Data Retention

Reliability Qualification results show that the projected data retention failure rate is much less than 1 PPM over 20 years at 85°C or 100 years at 25°C.

- Notes: 1. When the OCDEN Fuse is unprogrammed, the OSCCAL Register is always accessed on this address. Refer to the debugger specific documentation for details on how to use the OCDR Register.
 - 2. Refer to the USART description for details on how to access UBRRH and UCSRC.
 - 3. For compatibility with future devices, reserved bits should be written to zero if accessed. Reserved I/O memory addresses should never be written.
 - 4. Some of the Status Flags are cleared by writing a logical one to them. Note that the CBI and SBI instructions will operate on all bits in the I/O Register, writing a one back into any flag read as set, thus clearing the flag. The CBI and SBI instructions work with registers \$00 to \$1F only.

Instruction Set Summary

Mnemonics	Operands	Description	Operation	Flags	#Clocks
ARITHMETIC AND	LOGIC INSTRUCTION	S		•	
ADD	Rd, Rr	Add two Registers	$Rd \leftarrow Rd + Rr$	Z,C,N,V,H	1
ADC	Rd, Rr	Add with Carry two Registers	$Rd \leftarrow Rd + Rr + C$	Z,C,N,V,H	1
ADIW	Rdl,K	Add Immediate to Word	$Rdh:Rdl \leftarrow Rdh:Rdl + K$	Z,C,N,V,S	2
SUB	Rd, Rr	Subtract two Registers	$Rd \leftarrow Rd - Rr$	Z,C,N,V,H	1
SUBI	Rd, K	Subtract Constant from Register	Rd ← Rd - K	Z,C,N,V,H	1
SBC	Rd, Rr	Subtract with Carry two Registers	$Rd \leftarrow Rd - Rr - C$	Z,C,N,V,H	1
SBCI	Rd, K	Subtract with Carry Constant from Reg.	$Rd \leftarrow Rd - K - C$	Z,C,N,V,H	1

Note: 1. Pb-free packaging complies to the European Directive for Restriction of Hazardous Substances (RoHS directive). Also Halide free and fully Green.

	Package Type
44A	44-lead, Thin (1.0 mm) Plastic Gull Wing Quad Flat Package (TQFP)
40P6	40-pin, 0.600" Wide, Plastic Dual Inline Package (PDIP)
44M1	44-pad, 7 x 7 x 1.0 mm body, lead pitch 0.50 mm, Quad Flat No-Lead/Micro Lead Frame Package (QFN/MLF)

Packaging Information

44A

- 1. This package conforms to JEDEC reference MS-026, Variation ACB.
- 2. Dimensions D1 and E1 do not include mold protrusion. Allowable protrusion is 0.25 mm per side. Dimensions D1 and E1 are maximum plastic body size dimensions including mold mismatch.
- 3. Lead coplanarity is 0.10 mm maximum.

Errata

The revision letter in this section refers to the revision of the ATmega16 device.

ATmega16(L) Rev. M

- First Analog Comparator conversion may be delayed
- Interrupts may be lost when writing the timer registers in the asynchronous timer
- IDCODE masks data from TDI input
- Reading EEPROM by using ST or STS to set EERE bit triggers unexpected interrupt request

1. First Analog Comparator conversion may be delayed

If the device is powered by a slow rising V_{CC} , the first Analog Comparator conversion will take longer than expected on some devices.

Problem Fix/Workaround

When the device has been powered or reset, disable then enable the Analog Comparator before the first conversion.

2. Interrupts may be lost when writing the timer registers in the asynchronous timer

The interrupt will be lost if a timer register that is synchronized to the asynchronous timer clock is written when the asynchronous Timer/Counter register(TCNTx) is 0x00.

Problem Fix / Workaround

Always check that the asynchronous Timer/Counter register neither have the value 0xFF nor 0x00 before writing to the asynchronous Timer Control Register(TCCRx), asynchronous Timer Counter Register(TCNTx), or asynchronous Output Compare Register(OCRx).

3. IDCODE masks data from TDI input

The JTAG instruction IDCODE is not working correctly. Data to succeeding devices are replaced by all-ones during Update-DR.

Problem Fix / Workaround

- If ATmega16 is the only device in the scan chain, the problem is not visible.
- Select the Device ID Register of the ATmega16 by issuing the IDCODE instruction or by entering the Test-Logic-Reset state of the TAP controller to read out the contents of its Device ID Register and possibly data from succeeding devices of the scan chain. Issue the BYPASS instruction to the ATmega16 while reading the Device ID Registers of preceding devices of the boundary scan chain.
- If the Device IDs of all devices in the boundary scan chain must be captured simultaneously, the ATmega16 must be the fist device in the chain.

4. Reading EEPROM by using ST or STS to set EERE bit triggers unexpected interrupt request.

Reading EEPROM by using the ST or STS command to set the EERE bit in the EECR register triggers an unexpected EEPROM interrupt request.

Problem Fix / Workaround

Always use OUT or SBI to set EERE in EECR.

Datasheet Revision History

Please note that the referring page numbers in this section are referred to this document. The referring revision in this section are referring to the document revision.

Rev. 2466T-07/10

- 1. Corrected use of comma in formula Rp in Table 120, "Two-wire Serial Bus Requirements," on page 294.
- 2. Updated document according to Atmel's Technical Terminology
- 3. Note 6 and Note 7 under Table 120, "Two-wire Serial Bus Requirements," on page 294 have been removed.

Rev. 2466S-05/09

- 1. Updated "Errata" on page 340.
- 2. Updated the last page with Atmel's new adresses.

Rev. 2466R-06/08

1. Added "Not recommended for new designs" note in Figure on page 1.

Rev. 2466Q-05/08

- Updated "Fast PWM Mode" on page 77 in "8-bit Timer/Counter0 with PWM" on page 71:
 - Removed the last section describing how to achieve a frequency with 50% duty cycle waveform output in fast PWM mode.
- 2. Removed note from Feature list in "Analog to Digital Converter" on page 204.
- 3. Removed note from Table 84 on page 218.
- 4. Updated "Ordering Information" on page 336:
 - Commercial ordering codes removed.
 - Non Pb-free package option removed.

Rev. 2466P-08/07

- 1. Updated "Features" on page 1.
- 2. Added "Data Retention" on page 6.
- 3. Updated "Errata" on page 340.
- 4. Updated "Slave Mode" on page 140.

Rev. 2466O-03/07

- 1. Updated "Calibrated Internal RC Oscillator" on page 29.
- 2. Updated C code example in "USART Initialization" on page 149.
- 3. Updated "ATmega16 Boundary-scan Order" on page 241.
- 4. Removed "premilinary" from "ADC Characteristics" on page 297.
- Updated from V to mV in "I/O Pin Input Hysteresis vs. V_{CC}" on page 317.
- 6. Updated from V to mV in "Reset Input Pin Hysteresis vs. V_{CC}" on page 318.

Rev. 2466N-10/06

- 1. Updated "Timer/Counter Oscillator" on page 31.
- 2. Updated "Fast PWM Mode" on page 102.
- 3. Updated Table 38 on page 83, Table 40 on page 84, Table 45 on page 111, Table 47 on page 112, Table 50 on page 128 and Table 52 on page 129.
- 4. Updated C code example in "USART Initialization" on page 149.
- 5. Updated "Errata" on page 340.

Rev. 2466M-04/06

- 1. Updated typos.
- 2. Updated "Serial Peripheral Interface SPI" on page 135.
- 3. Updated Table 86 on page 221, Table 116 on page 276 ,Table 121 on page 295 and Table 122 on page 297.

Rev. 2466L-06/05

- 1. Updated note in "Bit Rate Generator Unit" on page 178.
- 2. Updated values for V_{INT} in "ADC Characteristics" on page 297.
- 3. Updated "Serial Programming Instruction set" on page 276.
- 4. Updated USART init C-code example in "USART" on page 144.

Rev. 2466K-04/05

- 1. Updated "Ordering Information" on page 336.
- 2. MLF-package alternative changed to "Quad Flat No-Lead/Micro Lead Frame Package QFN/MLF".
- 3. Updated "Electrical Characteristics" on page 291.

Rev. 2466J-10/04

1. Updated "Ordering Information" on page 336.

Rev. 2466I-10/04

- 1. Removed references to analog ground.
- 2. Updated Table 7 on page 28, Table 15 on page 38, Table 16 on page 42, Table 81 on page 209, Table 116 on page 276, and Table 119 on page 293.
- 3. Updated "Pinout ATmega16" on page 2.
- 4. Updated features in "Analog to Digital Converter" on page 204.
- 5. Updated "Version" on page 229.
- Updated "Calibration Byte" on page 261.
- 7. Added "Page Size" on page 262.

Rev. 2466H-12/03

1. Updated "Calibrated Internal RC Oscillator" on page 29.

Rev. 2466G-10/03

- 1. Removed "Preliminary" from the datasheet.
- 2. Changed ICP to ICP1 in the datasheet.
- 3. Updated "JTAG Interface and On-chip Debug System" on page 36.
- Updated assembly and C code examples in "Watchdog Timer Control Register WDTCR" on page 43.
- 5. Updated Figure 46 on page 103.
- 6. Updated Table 15 on page 38, Table 82 on page 217 and Table 115 on page 276.
- 7. Updated "Test Access Port TAP" on page 222 regarding JTAGEN.
- 8. Updated description for the JTD bit on page 231.
- 9. Added note 2 to Figure 126 on page 252.
- 10. Added a note regarding JTAGEN fuse to Table 105 on page 260.
- 11. Updated Absolute Maximum Ratings* and DC Characteristics in "Electrical Characteristics" on page 291.
- 12. Updated "ATmega16 Typical Characteristics" on page 299.
- 13. Fixed typo for 16 MHz QFN/MLF package in "Ordering Information" on page 336.
- 14. Added a proposal for solving problems regarding the JTAG instruction IDCODE in "Errata" on page 340.

Rev. 2466F-02/03

- 1. Added note about masking out unused bits when reading the Program Counter in "Stack Pointer" on page 12.
- 2. Added Chip Erase as a first step in "Programming the Flash" on page 288 and "Programming the EEPROM" on page 289.
- 3. Added the section "Unconnected pins" on page 55.
- 4. Added tips on how to disable the OCD system in "On-chip Debug System" on page
- 5. Removed reference to the "Multi-purpose Oscillator" application note and "32 kHz Crystal Oscillator" application note, which do not exist.
- 6. Added information about PWM symmetry for Timer0 and Timer2.
- 7. Added note in "Filling the Temporary Buffer (Page Loading)" on page 253 about writing to the EEPROM during an SPM Page Load.
- 8. Removed ADHSM completely.

- 9. Added Table 73, "TWI Bit Rate Prescaler," on page 182 to describe the TWPS bits in the "TWI Status Register TWSR" on page 181.
- 10. Added section "Default Clock Source" on page 25.
- 11. Added note about frequency variation when using an external clock. Note added in "External Clock" on page 31. An extra row and a note added in Table 118 on page 293.
- 12. Various minor TWI corrections.
- 13. Added "Power Consumption" data in "Features" on page 1.
- 14. Added section "EEPROM Write During Power-down Sleep Mode" on page 22.
- 15. Added note about Differential Mode with Auto Triggering in "Prescaling and Conversion Timing" on page 207.
- 16. Added updated "Packaging Information" on page 337.

Rev. 2466E-10/02

1. Updated "DC Characteristics" on page 291.

Rev. 2466D-09/02

- 1. Changed all Flash write/erase cycles from 1,000 to 10,000.
- 2. Updated the following tables: Table 4 on page 26, Table 15 on page 38, Table 42 on page 85, Table 45 on page 111, Table 46 on page 111, Table 59 on page 143, Table 67 on page 167, Table 90 on page 235, Table 102 on page 258, "DC Characteristics" on page 291, Table 119 on page 293, Table 121 on page 295, and Table 122 on page 297.
- 3. Updated "Errata" on page 340.

Rev. 2466C-03/02

- 1. Updated typical EEPROM programming time, Table 1 on page 20.
- 2. Updated typical start-up time in the following tables:

Table 3 on page 25, Table 5 on page 27, Table 6 on page 28, Table 8 on page 29, Table 9 on page 29, and Table 10 on page 29.

- 3. Updated Table 17 on page 43 with typical WDT Time-out.
- 4. Added Some Preliminary Test Limits and Characterization Data.

Removed some of the TBD's in the following tables and pages:

Table 15 on page 38, Table 16 on page 42, Table 116 on page 272 (table removed in document review #D), "Electrical Characteristics" on page 291, Table 119 on page 293, Table 121 on page 295, and Table 122 on page 297.

5. Updated TWI Chapter.

Added the note at the end of the "Bit Rate Generator Unit" on page 178.

- Corrected description of ADSC bit in "ADC Control and Status Register A ADCSRA" on page 219.
- 7. Improved description on how to do a polarity check of the ADC doff results in "ADC Conversion Result" on page 216.

- 8. Added JTAG version number for rev. H in Table 87 on page 229.
- 9. Added not regarding OCDEN Fuse below Table 105 on page 260.
- 10. Updated Programming Figures:

Figure 127 on page 262 and Figure 136 on page 273 are updated to also reflect that AVCC must be connected during Programming mode. Figure 131 on page 269 added to illustrate how to program the fuses.

- 11. Added a note regarding usage of the "PROG_PAGELOAD (\$6)" on page 280 and "PROG_PAGEREAD (\$7)" on page 280.
- **12.** Removed alternative algorthhm for leaving JTAG Programming mode. See "Leaving Programming Mode" on page 288.
- 13. Added Calibrated RC Oscillator characterization curves in section "ATmega16 Typical Characteristics" on page 299.
- 14. Corrected ordering code for QFN/MLF package (16MHz) in "Ordering Information" on page 336.
- 15. Corrected Table 90, "Scan Signals for the Oscillators (1)(2)(3)," on page 235.
