2. Internal CPU Function

2.1 Program Counter (PC)

The program counter is a 11-bit binary counter which indicates the address of the program memory storing the next instruction to be executed. Normally, the PC is incremented by the number of bytes of the instruction every time it is fetched. When a branch instruction or a subroutine instruction has been executed or an interrupt has been accepted, the specified values listed in Table 2-1 are set to the PC. The PC is initialized to "0" during reset.

Figure 2-1. Configuration of Program Counter

The PC can directly address a 2048-byte address space. However, with the short branch, the following points must be considered:

- Short branch instruction [BSS a]

In [BSS a] instruction execution, when the branch condition is satisfied, the value specified in the instruction is set to the lower 6 bits of the PC. That is, [BSS a] becomes the in-page branch instruction. When [BSS a] is stored at the last address of the page, the upper 5 bits of the PC point the next page, so that branch is made to the next page.

Table 2-1. Status Change of Program Counter

Instruction or Operation		Condition		Program Counter (PC)										
				PC ₁₀	PC ₉	PC ₈	PC ₇	PC ₆	PC ₅	PC ₄	PC ₃	PC ₂	PC ₁	PC ₀
Execution of Instruction	BS a	SF = 1 (Branch condition is satisfied)		Immediate data specified by the instruction										
		SF = 0 (Branch condition is not satisfied)		+ 2										
	BSS a	SF = 1	Lower 6-bit address ≠ 111111	Hold				Immediate data specified by the instruction						
			Lower 6-bit address = 111111 (last address in page)	+ 1				Immediate data specified by the instruction						
		SF = 0		+ 1										
	CALL a			Immediate data specified by the instruction										
	CALLS a			0	0	0	The data generated by the immediate data specified by the instruction				1	1	0	
	RET			The return address restored from stack										
	RETI			The return address restored from stack										
	Others			Incremented by the number of bytes in the instruction										
Interrupt acceptance				0	0	0	0	0	0	0	Interrupt vector			0
Reset				0	0	0	0	0	0	0	0	0	0	0

2.2 Program Memory (ROM)

Programs and fixed data are stored in the program memory. The instruction to be executed next is read from the address indicated by the contents of the PC.

The fixed data can be read by using the table look-up instructions.

- Table look-up instructions

[LDL A, @DC], [LDH A, @DC +]

The table look-up instructions read the lower and upper 4 bits of the fixed data stored at the address specified in the data counter (DC) to place them into the accumulator. [LDL A, @DC] instruction reads the lower 4 bits of fixed data, and [LDH A, @DC +] instruction reads the upper 4 bits.

The DC is a 12-bit register, allowing it to address the entire program memory space.

In this case, the upper bit of the DC (MSB) is ignored.
(not effective valid)

Figure 2-2. Configuration of Program Memory

2.2.1 Program Memory Capacity

The TMP47C101 has 1024×8 bits (addresses 000H through 3FFH) of program memory (mask ROM), the TMP47C201 has 2048×8 bits (addresses 000H through 7FFH).

Figure 2-3 shows the program memory map. Address 000H - 086H of the program memory are also used for special purposes.

2.2.2 Program Memory Map

On the TMP47C101, no physical program memory exists in the address range 400_H through 7FF_H. However, if this space is accessed by program, the most significant bit of each address is always regarded as "0" and the contents of the program memory corresponding to the address 000_H through 3FF_H are read.

Note: Address 004_H and 005_H can be used to store ordinary user's processing data.

Output Voltage	V _{OUT}		– 0.3 to V _{DD} + 0.3	V
Output Current (Per 1 pin)	I _{OUT1}	Port R4	30	mA
	I _{OUT2}	Ports R5, R8, $\overline{\text{HOLD}}$	3.2	
Output Current (Total)	ΣI_{OUT}	Port R4	60	mA
Power Dissipation [T _{opr} = 70°C]	PD	DIP	300	mW

Note: The absolute maximum ratings are rated values which must not be exceeded during operation, even for an instant. Any one of the ratings must not be exceeded. If any absolute maximum rating is exceeded, a device may break down or its performance may be degraded, causing it to catch fire or explode resulting in injury to the user. Thus, when designing products which include this device, ensure that no absolute maximum rating value will ever be exceeded.

			V _{DD} = 2.7 to 5.5 V		4.2	
			V _{DD} = 2.2 to 5.5 V (RC)		2.5	

Note: The recommended operating conditions for a device are operating conditions under which it can be guaranteed that the device will operate as specified. If the device is used under operating conditions other than the recommended operating conditions (supply voltage, operating temperature range, specified AC/DC values etc.), malfunction may occur. Thus, when designing products which include this device, ensure that the recommended operating conditions for the device are always adhered to.
