

## High-Voltage Integrated Switch PWM Boost Regulator with UVLO

### Features

- 36V, 400 mΩ Integrated Switch
- Up to 92% Efficiency
- Output Voltage Range: up to 32V
- 1.8A Peak Input Current Limit:
  - $I_{OUT} > 375 \text{ mA}$  @  $5.0\text{V } V_{IN}$ ,  $12\text{V } V_{OUT}$
  - $I_{OUT} > 200 \text{ mA}$  @  $3.3\text{V } V_{IN}$ ,  $12\text{V } V_{OUT}$
  - $I_{OUT} > 150 \text{ mA}$  @  $4.2\text{V } V_{IN}$ ,  $24\text{V } V_{OUT}$
- Input Voltage Range: 2.4V to 5.5V
- Undervoltage Lockout (UVLO):
  - UVLO @  $V_{IN}$  Rising: 2.3V, typical
  - UVLO @  $V_{IN}$  Falling: 1.85V, typical
- No Load Input Current: 250  $\mu\text{A}$ , typical
- Sleep mode with 0.3  $\mu\text{A}$  Typical Shutdown Quiescent Current
- PWM Operation with Skip Mode: 500 kHz
- Feedback Voltage Reference:  $V_{FB} = 1.227\text{V}$
- Cycle-by-Cycle Current Limiting
- Internal Compensation
- Inrush Current Limiting and Internal Soft Start
- Output Overvoltage Protection (OVP) in the event of:
  - Feedback pin shorted to GND
  - Disconnected feedback divider
- Overtemperature Protection
- Easily Configurable for SEPIC, Cuk or Flyback Topologies
- Available Packages:
  - 5-Lead SOT-23
  - 8-Lead 2x3 TDFN

### Applications

- Two and Three-Cell Alkaline, Lithium Ultimate and NiMH/NiCd Portable Products
- Single-Cell Li-Ion to 5V, 12V or 24V Converters
- LCD Bias Supply for Portable Applications
- Camera Phone Flash
- Portable Medical Equipment
- Hand-Held Instruments

### General Description

The MCP1663 device is a compact, high-efficiency, fixed-frequency, non-synchronous step-up DC-DC converter which integrates a 36V, 400 mΩ NMOS switch. It provides a space-efficient high-voltage step-up power supply solution for applications powered by either two-cell or three-cell alkaline, Ultimate Lithium, NiCd, NiMH, one-cell Li-Ion or Li-Polymer batteries.

The integrated switch is protected by the 1.8A cycle-by-cycle inductor peak current limit operation. There is an output overvoltage protection which turns off switching in case the feedback resistors are accidentally disconnected or the feedback pin is short-circuited to GND.

Low-voltage technology allows the regulator to start-up without high inrush current or output voltage overshoot from a low-voltage input. The device features a UVLO which avoids start-up and operation with low inputs or discharged batteries for two cell-powered applications.

For standby applications ( $EN = \text{GND}$ ), the device stops switching, enters sleep mode and consumes 0.3  $\mu\text{A}$  (typical) of input current.

MCP1663 is easy to use and allows creating classic boost, SEPIC or flyback DC-DC converters within a small Printed Circuit Board (PCB) area. All compensation and protection circuitry is integrated to minimize the number of external components. Ceramic input and output capacitors are used.

### Package Types

# MCP1663

## Typical Applications

## 1.0 ELECTRICAL CHARACTERISTICS

### Absolute Maximum Ratings †

$V_{SW} - GND$	.....+36V
$EN, V_{IN} - GND$	.....+6.0V
$V_{FB}$	.....+1.3V
Power Dissipation	.....Internally Limited
Storage Temperature	.....-65°C to +150°C
Ambient Temperature with Power Applied	.....-40°C to +125°C
Operating Junction Temperature	.....-40°C to +150°C
ESD Protection On All Pins:	
HBM	.....4 kV
MM	.....400V

† **Notice:** Stresses above those listed under “Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational sections of this specification is not intended. Exposure to maximum rating conditions for extended periods may affect device reliability.

## DC AND AC CHARACTERISTICS

<b>Electrical Specifications:</b> Unless otherwise specified, all limits apply for typical values at ambient temperature $T_A = +25^\circ\text{C}$ , $V_{IN} = 3.3\text{V}$ , $I_{OUT} = 20\text{ mA}$ , $V_{OUT} = 12\text{V}$ , $C_{IN} = C_{OUT} = 10\text{ }\mu\text{F}$ , X7R ceramic, $L = 4.7\text{ }\mu\text{H}$ . <b>Boldface</b> specifications apply over the controlled $T_A$ range of $-40^\circ\text{C}$ to $+125^\circ\text{C}$ .						
Parameters	Sym.	Min.	Typ.	Max.	Units	Conditions
Input Voltage Range	$V_{IN}$	2.4	—	5.5	V	<a href="#">Note 1</a>
Undervoltage Lockout (UVLO)	$UVLO_{START}$	—	2.3	—	V	$V_{IN}$ rising, $I_{OUT} = 1\text{ mA}$ resistive load
	$UVLO_{STOP}$	—	1.85	—	V	$V_{IN}$ falling, $I_{OUT} = 1\text{ mA}$ resistive load
Output Voltage Adjust Range	$V_{OUT}$	—	—	32	V	<a href="#">Note 1</a>

### 3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in [Table 3-1](#).

**TABLE 3-1: PIN FUNCTION TABLE**

MCP1663 2x3 TDFN	MCP1663 SOT-23	Symbol	Description
1	3	$V_{FB}$	Feedback Voltage Pin
2	—	$S_{GND}$	Signal Ground Pin ( <b>TDFN only</b> )
3	1	SW	Switch Node, Boost Inductor Input Pin
4, 6	—	NC	Not Connected
5	5	$V_{IN}$	Input Voltage Pin
7	—	$P_{GND}$	Power Ground Pin ( <b>TDFN only</b> )
8	4	EN	Enable Control Input Pin
9	—	EP	Exposed Thermal Pad (EP); must be connected to Ground. ( <b>TDFN only</b> )
—	2	GND	Ground Pin ( <b>SOT-23 only</b> )

#### 3.1 Feedback Voltage Pin ( $V_{FB}$ )

The  $V_{FB}$  pin is used to provide output voltage regulation by using a resistor divider. The  $V_{FB}$  voltage is 1.227V typical.

#### 3.2 Signal Ground Pin ( $S_{GND}$ )

The signal ground pin is used as a return for the integrated reference voltage and error amplifier. The signal ground and power ground must be connected externally in one point.

#### 3.3 Switch Node Pin (SW)

Connect the inductor from the input voltage to the SW pin. The SW pin carries inductor current, which is 1.8A peak typically. The integrated N-Channel switch drain is internally connected to the SW node.

#### 3.4 Not Connected (NC)

This is an unconnected pin.

#### 3.5 Power Supply Input Voltage Pin ( $V_{IN}$ )

Connect the input voltage source to  $V_{IN}$ . The input source must be decoupled from GND with a 4.7  $\mu$ F minimum capacitor.

#### 3.6 Power Ground Pin ( $P_{GND}$ )

The power ground pin is used as a return for the high-current N-Channel switch. The signal ground and power ground must be connected externally in one point.

#### 3.7 Enable Pin (EN)

The EN pin is a logic-level input used to enable or disable device switching and lower quiescent current while disabled. A logic high (>85% of  $V_{IN}$ ) will enable the regulator output. A logic low (<7.5% of  $V_{IN}$ ) will ensure that the regulator is disabled.

#### 3.8 Exposed Thermal Pad (EP)

There is no internal electrical connection between the Exposed Thermal Pad (EP) and the  $S_{GND}$  and  $P_{GND}$  pins. They must be connected to the same potential on the PCB.

#### 3.9 Ground Pin (GND)

The ground or return pin is used for circuit ground connection. The length of the trace from the input cap return, the output cap return and the GND pin must be as short as possible to minimize noise on the GND pin. The 5-lead SOT-23 package uses a single ground pin.

# MCP1663

---

NOTES:

## 4.0 DETAILED DESCRIPTION

### 4.1 Device Overview

MCP1663 is a constant frequency PWM boost (step-up) converter, based on a peak current mode architecture which delivers high efficiency over a wide load range from two-cell and three-cell Alkaline, Ultimate Lithium, NiMH, NiCd and single-cell Li-Ion battery inputs. A high level of integration lowers total system cost, eases implementation and reduces board area.

The device features controlled start-up voltage (UVLO), adjustable output voltage, 500 kHz PWM operation with Skipping mode, 36V integrated switch, internal compensation, inrush current limit, soft start, and overvoltage protection in case the  $V_{FB}$  connection is lost.

The typical 400 m $\Omega$ , 36V integrated switch is protected by the 1.8A cycle-by-cycle inductor peak current operation. When the Enable pin is pulled to ground (EN = GND), the device stops switching, enters in Shutdown mode and consumes approximately 300 nA of input current (the feedback current is not included).

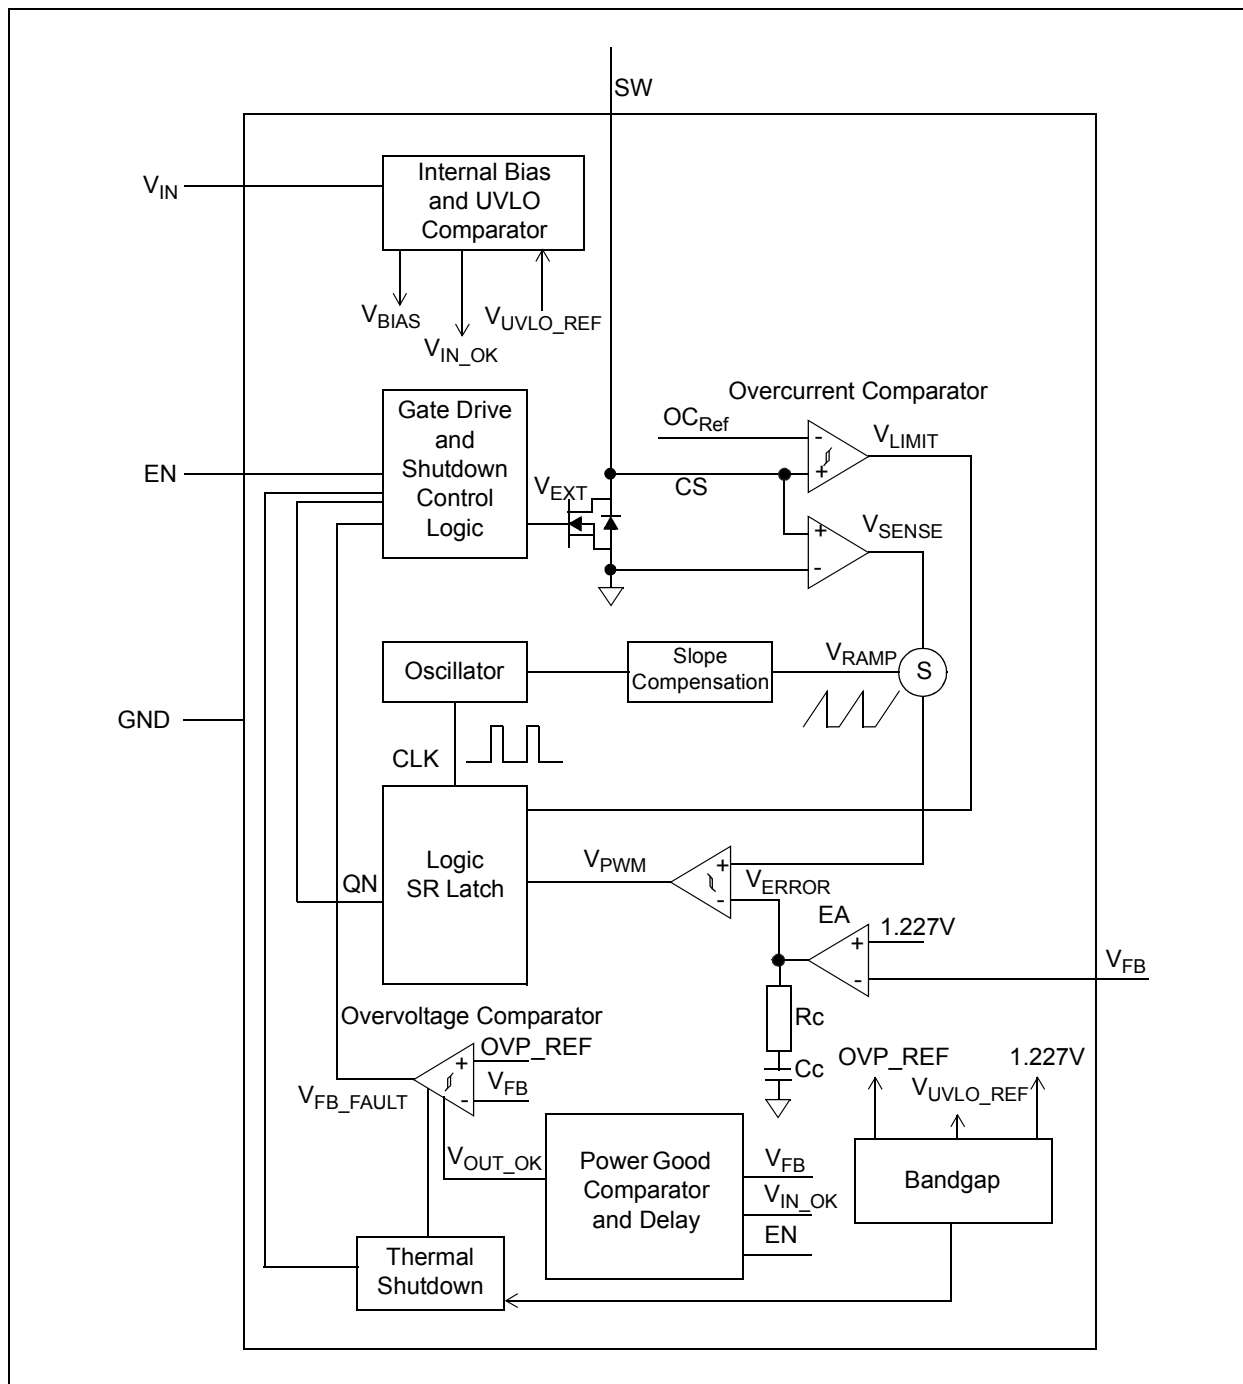

MCP1663 can be used to build classic boost, SEPIC or flyback DC-DC converters.

# MCP1663

## 4.2 Functional Description

The MCP1663 device is a compact, high-efficiency, fixed-frequency, step-up DC-DC converter that provides an easy-to-use high-output power supply solution for applications powered by either two-cell or three-cell alkaline or Lithium Energizer, three-cell NiCd or NiMH or one-cell Li-Ion or Li-Polymer batteries.

Figure 4-1 depicts the functional block diagram of the MCP1663 device. It incorporates a current mode control scheme, in which the PWM ramp signal is derived from the NMOS power switch current ( $V_{SENSE}$ ). This ramp signal adds slope ramp compensation signal ( $V_{RAMP}$ ) and is compared to the output of the error amplifier ( $V_{ERROR}$ ) to control the on-time of the power switch. A proper slope rate will be designed to improve circuit stability.

**FIGURE 4-1:** MCP1663 Simplified Block Diagram.

## 4.2.1 INTERNAL BIAS

The MCP1663 device gets its bias from  $V_{IN}$ . The  $V_{IN}$  bias is used to power the device and drive circuits over the entire operating range. The maximum  $V_{IN}$  is 5.5V.

## 4.2.2 START-UP VOLTAGE AND SOFT START

The MCP1663 device starts at input voltages that are higher than or equal to a predefined set UVLO value. MCP1663 starts switching at 2.3V for 12.0V typical. Once started, the device will continue to operate under normal load conditions down to 1.85V typical. There is a soft start feature which provides a way to limit the inrush current drawn from the input (batteries) during start-up. The soft start has an important role in applications where the switch will reach 32V. During start-up, excessively high switch current, together with the presence of high voltage, can overstress the NMOS switch.

When the device is powered ( $EN = V_{IN}$  and  $V_{IN}$  rises from zero to its nominal value), the output capacitor charges to a value close to the input voltage (or  $V_{IN}$  minus a Schottky diode voltage drop). The overshoot on output is limited by slowly increasing the reference of the error amplifier. There is an internal reference voltage circuit which charges an internal capacitor with a weak current source. The voltage on this capacitor slowly ramps the reference voltage. The soft-start capacitor is completely discharged in the event of a commanded shutdown or a thermal shutdown.

Due to the direct path from input to output, in the case of start-up by enable ( $EN$  voltage switches from low-to-high), the output capacitor is already charged and the output starts from a value close to the input voltage (Figure 2-17).

The internal oscillator has a delayed start to let the output capacitor be completely charged to the input voltage value.

## 4.2.3 UNDERVOLTAGE LOCKOUT (UVLO)

MCP1663 features an UVLO which prevents fault operation below 1.85V, which corresponds to the value of two discharged primary cells. The device starts its normal operation at approximately 2.3V input. The upper limit is set to avoid any input transients (temporary  $V_{IN}$  drop), which might trigger the lower UVLO threshold and restart the device. Usually, these voltage transients (overshoots and undershoots) have up to a few hundreds mV.

MCP1663 is a non-synchronous boost regulator. Due to this fact, there is a direct path from  $V_{IN}$  to  $V_{OUT}$  through the inductor and the diode. This means that, while the device is not switching ( $V_{IN}$  below  $UVLO_{STOP}$  threshold),  $V_{OUT}$  is not zero but equal to  $V_{IN} - V_F$  (where  $V_F$  is the voltage drop on the rectifier diode).

When the input voltage is below the 2.3V UVLO start threshold, the device is operating with limited specification. See [Section 2.0 “Typical Performance Curves”](#) for more information.

## 4.2.4 PWM MODE OPERATION

MCP1663 operates as a fixed-frequency, non-synchronous converter. The switching frequency is maintained at 500 kHz with a precision oscillator.

Lossless current sensing converts the peak current signal to a voltage ( $V_{SENSE}$ ) and adds it to the internal slope compensation ( $V_{RAMP}$ ). This summed signal is compared to the voltage error amplifier output ( $V_{ERROR}$ ) to provide a peak current control signal ( $V_{PWM}$ ) for the PWM control block. The slope compensation signal depends on the input voltage. Therefore, the converter provides the proper amount of slope compensation to ensure stability. The peak current is set to 1.8A.

The MCP1663 device will operate in PWM even during periods of light load operation by skipping pulses. By operating in PWM mode, the output ripple is low and the frequency is constant.

## 4.2.5 ADJUSTABLE OUTPUT VOLTAGE

The MCP1663 output voltage is adjustable with a resistor divider over the  $V_{OUT}$  range. High value resistors are recommended to minimize power loss and keep efficiency high at light loads. The device integrates a transconductance-type error amplifier and the values of the feedback resistors do not influence the stability of the system.

## 4.2.6 MINIMUM INPUT VOLTAGE AND MAXIMUM OUTPUT CURRENT

The maximum output current for which the device can supply the load is dependent upon the input and output voltage. The minimum input voltage necessary to reach the value of the desired output depends on the maximum duty cycle in accordance with the mathematical relation  $V_{OUT} = V_{INmin}/(1 - D_{MAX})$ . As there is a 1.8A inductor peak current limit,  $V_{OUT}$  can go out of regulation before reaching the maximum duty cycle.

For example, to ensure a 200 mA load current for  $V_{OUT} = 12.0V$ , a minimum of 3.0V input voltage is necessary. If an application is powered by one Li-Ion battery ( $V_{IN}$  from 3.3V to 4.2V), the minimum load current the MCP1663 device can deliver is close to 125 mA at 24.0V output (see [Figure 2-3](#)).

## 4.2.7 ENABLE PIN

The MCP1663 device is enabled when the EN pin is set high. The device is put into Shutdown mode when the EN pin is set low. To enable the boost converter, the EN voltage level must be greater than 85% of the  $V_{IN}$  voltage. To disable the boost converter, the EN voltage must be less than 7.5% of the  $V_{IN}$  voltage.

In Shutdown mode, the MCP1663 device stops switching and all internal control circuitry is switched off. On boost configuration, the input voltage will be bypassed to output through the inductor and the Schottky diode. In the SEPIC converter, Shutdown mode acts as output disconnect.

## 4.2.8 INTERNAL COMPENSATION

The error amplifier, with its associated compensation network, completes the closed-loop system by comparing the output voltage to a reference at the input of the error amplifier and by feeding the amplified and inverted error voltage to the control input of the inner current loop. The compensation network provides phase leads and lags at appropriate frequencies to cancel excessive phase lags and leads of the power circuit. All necessary compensation components and slope compensation are integrated.

## 4.2.9 OUTPUT OVERVOLTAGE PROTECTION (OVP)

An internal  $V_{FB}$  fault signal turns off the PWM signal ( $V_{EXT}$ ) and MCP1663 stop switching in the event of:

- short circuit of the feedback pin to GND
- disconnection of the feedback divider from  $V_{OUT}$

For a regular boost converter without any protection implemented, if the  $V_{FB}$  voltage drops to ground potential, its N-Channel transistor will be forced to switch at full duty cycle. As result  $V_{OUT}$  rises and the SW pin's voltage will exceed the maximum rating and damages the boost regulator IC, the external components and the load. Because a lower feedback voltage can cause an output voltage overshoot, an undervoltage feedback comparator can be used to protect the circuit.

The MCP1663 has implemented a protection which turns off PWM switching when the  $V_{FB}$  pin's voltage drops to ground level. An additional comparator uses an 80 mV reference and monitors the  $V_{FB}$  voltage, and generates a  $V_{FB\_FAULT}$  signal for control logic circuits if the voltage decreases under this reference. Using an undervoltage feedback comparator, in addition with an UVLO input circuit, acts as a permanently Low Battery device turning off.

The OVP comparator is disabled during the start-up sequence and a thermal shutdown event.

## 4.2.10 OVERCURRENT LIMIT

The MCP1663 device uses a typical 1.8A cycle-by-cycle inductor peak current limit to protect the N-channel switch. There is an overcurrent comparator which resets the drive latch when the peak of the inductor current reaches the limit. In current limitation, the output voltage starts dropping.

The peak overcurrent limit reference is  $V_{IN}$  dependent to accommodate low and weak inputs.

## 4.2.11 OUTPUT SHORT CIRCUIT CONDITION

Like all non-synchronous boost converters, the MCP1663 inductor current will increase excessively during a short circuit on the converter's output. Short circuit on the output will cause the diode rectifier to fail and the inductor's temperature to rise. When the diode fails, the SW pin becomes a high-impedance node, it remains connected only to the inductor and the excessive resulted ringing will damage the MCP1663 device.

## 4.2.12 OVERTEMPERATURE PROTECTION

Overtemperature protection circuitry is integrated into the MCP1663 device. This circuitry monitors the device junction temperature and shuts the device off if the junction temperature exceeds the typical +150°C threshold. If this threshold is exceeded, the device will automatically restart when the junction temperature drops by 15°C. The output overvoltage protection (OVP) is reset during an overtemperature condition.

## 5.0 APPLICATION INFORMATION

### 5.1 Typical Applications

The MCP1663 non-synchronous boost regulator operates over a wide output voltage range up to 32V. The input voltage ranges from 2.4V to 5.5V. The device operates down to 1.85V input with limited specification. The UVLO thresholds are set to 2.3V when  $V_{IN}$  is ramping and to 1.85V when  $V_{IN}$  is falling. The power efficiency conversion is high for several decades of load range. Output current capability increases with the input voltage and decreases with the increasing output voltage. The maximum output current is based on the N-channel switch peak current limit, set to 1.8A, and on a maximum duty cycle of 90%. Typical characterization curves in this data sheet are presented to display the typical output current capability.

### 5.2 Adjustable Output Voltage Calculations

To calculate the resistor divider values for the MCP1663, the following equation can be used. Where  $R_{TOP}$  is connected to  $V_{OUT}$ ,  $R_{BOT}$  is connected to GND and both are connected to the  $V_{FB}$  input pin.

#### EQUATION 5-1:

$$R_{TOP} = R_{BOT} \times \left( \frac{V_{OUT}}{V_{FB}} - 1 \right)$$

#### EXAMPLE 5-1:

$V_{OUT} = 12.0V$   
 $V_{FB} = 1.227V$   
 $R_{BOT} = 120\text{ k}\Omega$   
 $R_{TOP} = 1053.6\text{ k}\Omega$  ( $V_{OUT} = 11.96V$  with a standard value of 1050 k $\Omega$ )

#### EXAMPLE 5-2:

$V_{OUT} = 24.0V$   
 $V_{FB} = 1.227V$   
 $R_{BOT} = 53\text{ k}\Omega$   
 $R_{TOP} = 983.67\text{ k}\Omega$  ( $V_{OUT} = 23.82V$  with a standard value of 976 k $\Omega$ )

The values of the two resistors,  $R_{TOP}$  and  $R_{BOT}$ , affect the no load input current and quiescent current. In Shutdown mode ( $EN = GND$ ), the device consumes approximately 0.3  $\mu A$ . With 24V output and 1 M $\Omega$  feedback divider, the current which this divider drains from input is 2.4  $\mu A$ . This value is much higher than what the device consumes. Keeping  $R_{TOP}$  and  $R_{BOT}$  high will optimize efficiency conversion at very light loads. There are some potential issues with higher value resistors, as in the case of small surface mount resistors; environment contamination can create leakage paths on the PCB that significantly change the resistor divider and may affect the output voltage tolerance.

#### 5.2.1 OVERVOLTAGE PROTECTION

The MCP1663 features an output overvoltage protection (OVP) in case  $R_{TOP}$  is disconnected from the  $V_{OUT}$  line. A 80 mV OVP reference is compared to  $V_{FB}$  voltage. If voltage on the  $V_{FB}$  pin drops below the reference value, the device stops switching and prevents  $V_{OUT}$  from rising up to a dangerous value.

OVP is not enabled during start-up and thermal shutdown events.

## 5.3 Input Capacitor Selection

The boost input current is smoothened by the boost inductor, reducing the amount of filtering necessary at the input. Some capacitance is recommended to provide decoupling from the input source. Because MCP1663 is rated to work up to 125°C, low ESR X7R ceramic capacitors are well suited, since they have a low temperature coefficient and are small-sized. For limited temperature range use at up to 85°C, a X5R ceramic capacitor can be used. For light load applications, 4.7  $\mu\text{F}$  of capacitance is sufficient at the input. For high-power applications that have high source impedance or long leads, using a 20-30  $\mu\text{F}$  input capacitor is recommended to sustain high input boost currents. Additional input capacitance can be added to provide a stable input voltage.

Table 5-1 contains the recommended range for the input capacitor value.

## 5.4 Output Capacitor Selection

The output capacitor helps provide a stable output voltage during sudden load transients and reduces the output voltage ripple. As with the input capacitor, X7R ceramic capacitor is recommended for this application. Using other capacitor types (aluminum or tantalum) with large ESR has impact on the converter's efficiency (see AN1337), maximum output power and stability. For limited temperature range (up to 85°C), X5R ceramic capacitors can be used. The DC rating of the output capacitor should be greater than the  $V_{\text{OUT}}$  value. Generally, ceramic capacitors lose up to 50% of their capacity when the voltage applied is close to the maximum DC rating. Choosing a capacitor with a safe higher DC rating or placing two capacitors in parallel assure enough capacity to correctly filter the output voltage.

The MCP1663 device is internally compensated so output capacitance range is limited. See Table 5-1 for the recommended output capacitor range.

An output capacitance higher than 10  $\mu\text{F}$  adds a better load step response and high-frequency noise attenuation, especially while stepping from light to heavy current loads. In addition, 2 x 10  $\mu\text{F}$  output capacitors ensure a better recovery of the output after a short period of overloading. The output of 2 x 10  $\mu\text{F}$  is also recommended in the situation where output voltage is lower than 8V.

While the N-Channel switch is on, the output current is supplied by the output capacitor  $C_{\text{OUT}}$ . The amount of output capacitance and equivalent series resistance will have a significant effect on the output ripple voltage. While  $C_{\text{OUT}}$  provides load current, a voltage drop also appears across its internal ESR that results in ripple voltage.

Peak-to-peak output ripple voltage also depends on the equivalent series inductance (ESL) of the output capacitor. There are ceramic capacitors with special internal architecture which minimize the ESL. Consult the ceramic capacitor's manufacturer portfolio for more information.

Table 5-1 contains the recommended range for the input and output capacitor value.

**TABLE 5-1: CAPACITOR VALUE RANGE**

	$C_{\text{IN}}$	$C_{\text{OUT}}$
Minimum	4.7 $\mu\text{F}$	10 $\mu\text{F}$
Maximum	—	47 $\mu\text{F}$

## 5.5 Inductor Selection

The MCP1663 device is designed to be used with small surface mount inductors; the inductance value can range from 4.7  $\mu\text{H}$  to 10  $\mu\text{H}$ . An inductance value of 4.7  $\mu\text{H}$  is recommended for output voltages below 15V. For higher output voltages, up to 32V, an inductance value of 10  $\mu\text{H}$  is optimum. While the device operates at low inputs, below 3.0V, a low value inductor (2.2  $\mu\text{H}$  or 3.3  $\mu\text{H}$ ) ensures better stability but limited output power capability. Usually, this is a good trade-off as boost converters powered from two-cell batteries are low-power applications.

**TABLE 5-2: MCP1663 RECOMMENDED INDUCTORS FOR BOOST CONVERTERS**

SLF7055-100	10	0.039	2.5	7.0x7.0x5.5

Several parameters are used to select the correct inductor: maximum-rated current, saturation current and copper resistance (DCR). For boost converters, the inductor current is much higher than the output current. The average inductor current is equal to the input current. The inductor's peak current is 30-40% higher than the average. The lower the inductor DCR, the higher the efficiency of the converter: a common trade-off in size versus efficiency.

The saturation current typically specifies a point at which the inductance has rolled off a percentage of the rated value. This can range from a 20% to 40% reduction in inductance. As inductance rolls off, the inductor ripple current increases, as does the peak switch current. It is important to keep the inductance from rolling off too much, causing switch current to reach the peak limit.

## 5.6 Rectifier Diode Selection

Schottky diodes are used to reduce losses. The diode's average forward current rating has to be equal or higher than the maximum output current. The diode's peak repetitive forward current rating has to be equal or higher than the inductor peak current. The diode's reverse breakdown voltage must be higher than the internal switch rating voltage of 36V.

The converter's efficiency will be improved if the voltage drop across the diode is lower. The average forward voltage rating is forward-current dependent, which is equal in particular to the load current.

For high currents and high ambient temperatures, use a diode with good thermal characteristics. See [Table 5-3](#) for recommended diodes.

**TABLE 5-3: RECOMMENDED SCHOTTKY DIODES**

Type	V <sub>OUTmax</sub>	Max T <sub>A</sub>
PMEG2010	18V	< 85°C
STPS120	18V	< 125°C
MBRM120	18V	< 125°C
PMEG4010	32V	< 85°C
UPS5819	32V	< 85°C
MBRM140	32V	< 125°C

## 5.7 SEPIC Converter Considerations

One of the advantages of using MCP1663 in SEPIC topology is the usage of an output disconnect feature.

Also, the output voltage may be lower or higher than the input voltage, resulting in buck or boost operation. Input voltage is limited to the 2.4-5.5V range.

One major advantage is that the SEPIC converter allows 3.0V or 3.3V buck-boost application from a Li-Ion battery with load disconnect. Also, SEPIC is recommended for higher output voltages where an input-to-output isolation is necessary (due to the coupling capacitor). An example of application is 5V Input to 12V output with isolated input to the output.

An application example is shown in [Figure 6-3](#).

The maximum output voltage, V<sub>OUTmax</sub>, must be limited to the sum of (V<sub>IN</sub> + V<sub>OUT</sub>) < 32V, which is the maximum internal switch DC rating. V<sub>IN</sub> must be lower than 5.5V.

Some extra aspects need to be taken into account when choosing the external components:

- the DC voltage rating of the coupling capacitor should be at least equal to the maximum input voltage
- the average current rating of the rectifier diodes is equal to the output load current
- the peak current of the rectifier diode is the same as the internal switch current, I<sub>SW</sub> = I<sub>IN</sub> + I<sub>OUT</sub>.

See the notes on [Figure 6-3](#) in [Section 6.0 "Typical Application Circuits"](#) for some recommended 1:1 coupled inductors.

# MCP1663

## 5.8 Thermal Calculations

The MCP1663 device is available in two different packages (5-lead SOT-23 and 8-lead 2x3 TDFN). By calculating the power dissipation and applying the package thermal resistance ( $\theta_{JA}$ ), the junction temperature is estimated. The maximum continuous junction temperature rating for the MCP1663 device is +125°C.

To quickly estimate the internal power dissipation for the switching boost regulator, an empirical calculation using measured efficiency can be used. Given the measured efficiency, the internal power dissipation is estimated by [Equation 5-2](#).

### EQUATION 5-2:

$$\left( \frac{V_{OUT} \times I_{OUT}}{\text{Efficiency}} \right) - (V_{OUT} \times I_{OUT}) = P_{Dis}$$

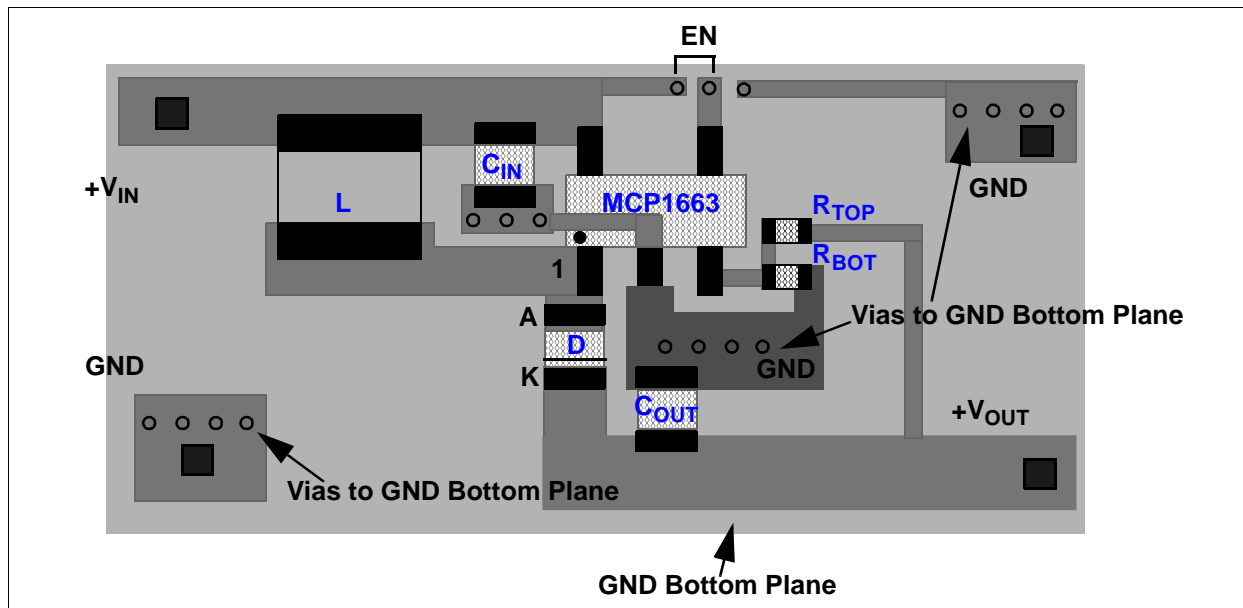

The difference between the first term, input power, and the second term, power delivered, is the power dissipated when using the MCP1661 device. This is an estimate, assuming that most of the power lost is internal to the MCP1663 and not  $C_{IN}$ ,  $C_{OUT}$ , the diode and the inductor. There is some percentage of power

lost in the boost inductor and rectifier diode, with very little loss in the input and output capacitors. For a more accurate estimation of the internal power dissipation, subtract the  $I_{INRMS}^2 \times L_{DCR}$  and  $I_{OUT} \times V_F$  power dissipation (where  $I_{INRMS}$  is the average input current,  $L_{DCR}$  is the inductor series resistance and  $V_F$  is the diode voltage drop).

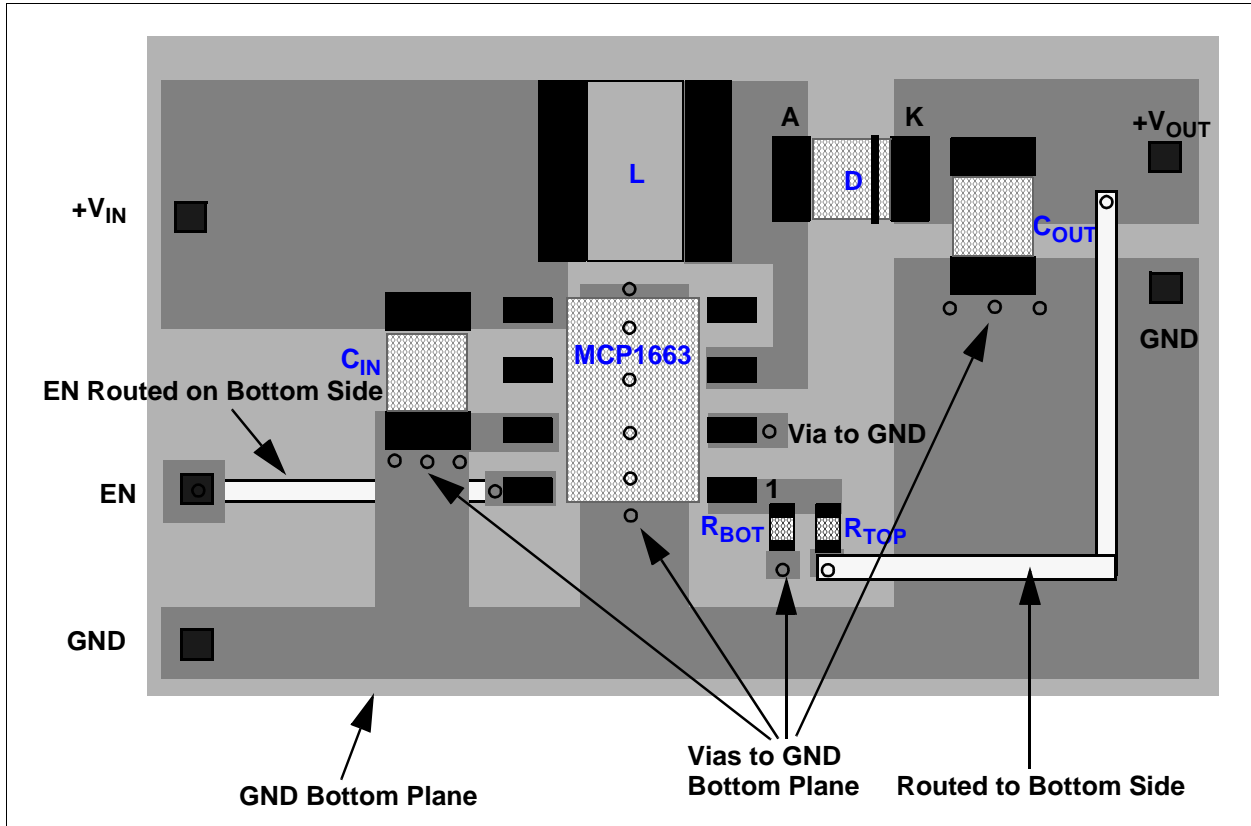

## 5.9 PCB Layout Information

Good printed circuit board layout techniques are important to any switching circuitry, and switching power supplies are no different. When wiring the switching high-current paths, short and wide traces should be used. Therefore, it is important that the input and output capacitors be placed as close as possible to the MCP1663 to minimize the loop area.

The feedback resistors and feedback signal should be routed away from the switching node and the switching current loop. When possible, ground planes and traces should be used to help shield the feedback signal and minimize noise and magnetic interference.

## 7.0 PACKAGING INFORMATION

### 7.1 Package Marking Information

8-Lead TDFN (2x3x0.75 mm)

Example

<b>Legend:</b>	XX...X	Customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week '01')
	NNN	Alphanumeric traceability code
	(e3)	Pb-free JEDEC® designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package.
<b>Note:</b>	In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.	

## 5-Lead Plastic Small Outline Transistor (OT) [SOT-23]

**Note:** For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>

		Units	MILLIMETERS

NOTES:

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
