Variable Sample Rate
True Line-Level Output

AC '97 FEATURES

Fully Compliant AC '97 Analog I/O Component
48-Lead LQFP Package
Multibit $\Sigma\Delta$ Converter Architecture for Improved
S/N Ratio greater than 90 dB
16-Bit Stereo Full-Duplex Codec
Four Analog Line-Level Stereo Inputs for Connection
from LINE, CD, VIDEO and AUX
Two Analog Line-Level Mono Inputs for Speakerphone
and PC BEEP
Mono MIC Input Switchable from Two External
Sources
High Quality CD Input with Ground Sense
Stereo Line-Level Output
Mono Output for Speakerphone or Internal Speaker
Power Management Support

ENHANCED FEATURES

Mobile Low Power Mixer Mode
Digital Audio Mixer Mode
DSP 16-Bit Serial Port Format, Slot 16 Mode
Supports All Required WHQL Sample Rates
Full Duplex Variable 7 kHz to 48 kHz Sampling Rate
with 1 Hz Resolution
Phat™ Stereo 3D Stereo Enhancement
Split Power Supplies (3.3 V Digital/5 V Analog)
Extended 6-Bit Master Volume Control
Audio Amp Power-Down Signal

CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the AD1881 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

AD1881

PRODUCT OVERVIEW

The AD1881 is the first audio Codec to meet the *Audio Codec '97 2.0 and 2.1 Extensions*. In addition, the AD1881 SoundMAX Codec is designed to meet all requirements of the *Audio Codec '97, Component Specification*, Revision 1.03, © 1996, Intel Corporation, found at www.Intel.com. The AD1881 also includes some other Codec enhanced features such as communicating to three Codecs on the same link, a DSP serial port mode, modem sample rates and filtering, and built-in Phat Stereo 3D enhancement.

The AD1881 is an analog front end for high performance PC audio, modem, or DSP applications. The AC '97 architecture defines a 2-chip audio solution comprising a digital audio controller, plus a high quality analog component that includes Digital-to-Analog Converters (DACs), Analog-to-Digital Converters (ADCs), mixer and I/O.

The main architectural features of the AD1881 are the high quality analog mixer section, two channels of $\Sigma\Delta$ ADC conversion, two channels of $\Sigma\Delta$ DAC conversion and Data Direct Scrambling (D²S) rate generators. The AD1881's left channel ADC and DAC are compatible for modem applications supporting irrational sample rates and modem filtering requirements.

FUNCTIONAL DESCRIPTION

This section overviews the functionality of the AD1881 and is intended as a general introduction to the capabilities of the device. Detailed reference information may be found in the descriptions of the Indexed Control Registers.

Analog Inputs

The Codec contains a stereo pair of $\Sigma\Delta$ ADCs. Inputs to the ADC may be selected from the following analog signals: telephony (PHONE_IN), mono microphone (MIC1 or MIC2), stereo line (LINE_IN), auxiliary line input (AUX), stereo CD ROM (CD), stereo audio from a video source (VIDEO) and post-mixed stereo or mono line output (LINE_OUT).

Analog Mixing

PHONE_IN, MIC1 or MIC2, LINE_IN, AUX, CD and VIDEO can be mixed in the analog domain with the stereo output from the DACs. Each channel of the stereo analog inputs may be independently gained or attenuated from +12 dB to -34.5 dB in 1.5 dB steps. The summing path for the mono inputs (PHONE_IN, MIC1, and MIC2 to LINE_OUT) duplicates mono channel data on both the left and right LINE_OUT. Additionally, the PC attention signal (PC_BEEP) may be mixed with the line output. A switch allows the output of the DACs to bypass the Phat Stereo 3D enhancement.

Digital Audio Mode

The AD1881 is designed with a Digital Audio Mode (DAM) that allows mixing of all analog inputs independent of the DAC output signal path. Mixed analog input signals may be sent to the ADCs for processing by the controller or the host, and may be used during simultaneous capture and playback at different sample rates.

Analog-to-Digital Signal Path

The selector sends left and right channel information to the programmable gain amplifier (PGA). The PGA following the selector allows independent gain control for each channel entering the ADC from 0 dB to +22.5 dB in 1.5 dB steps. Each channel of the ADC is independent, and can process left and right channel data at different sample rates.

Sample Rates and D²S

The AD1881 default mode sets the Codec to operate at 48 kHz sample rates. The converter pairs may process left and right channel data at different sample rates. The AD1881 sample rate generator allows the Codec to instantaneously change and process sample rates from 7 kHz to 48 kHz with a resolution of 1 Hz. The in-band integrated noise and distortion artifacts introduced by rate conversions are below -90 dB. The AD1881 uses a 4-bit D/A structure and Data Directed Scrambling (D²S) to enhance noise immunity on motherboards and in PC enclosures, and to suppress idle tones below the device's quantization noise floor. The D²S process pushes noise and distortion artifacts caused by errors in the multibit DAC to frequencies beyond the auditory response of the human ear and then filters them.

Digital-to-Analog Signal Path

The analog output of the DAC may be gained or attenuated from +12 dB to -34.5 dB in 1.5 dB steps, and summed with any of the analog input signals. The summed analog signal enters the Master Volume stage where each channel of the mixer output may be attenuated from 0 dB to -94.5 dB in 1.5 dB steps or muted.

Line-Level Outputs

The AD1881 offers a true line-level output for notebook docking station and home theater applications. The line-level output does not change with master volume settings.

Host-Based Echo Cancellation Support

The AD1881 supports time correlated I/O data format by presenting MIC data on the left channel of the ADC and the mono summation of left and right output on the right channel. The ADC is splittable; left and right ADC data can be sampled at different rates.

Power Management Modes

The AD1881 is designed to meet ACPI power consumption requirements through flexible power management control of all internal resources.

Odd register addresses are aliased to the next lower even address.

Reserved registers should not be written.

Zeros should be written to reserved bits.

*Indicates Aliased register for AD1819, AD1819A backward compatibility.

Reset (Index 00h)

Reg Num	Name	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
00h	Reset	X	SE4	SE3	SE2	SE1	SE0	ID9	ID8	ID7	ID6	ID5	ID4	ID3	ID2	ID1	ID0	0400h

Note: Writing any value to this register performs a register reset, which causes all registers to revert to their default values (except 74h, which forces the serial configuration). Reading this register returns the ID code of the part and a code for the type of 3D Stereo Enhancement.

ID[9:0] Identify Capability. The ID decodes the capabilities of AD1881 based on the following:

Bit = 1	Function	AD1881*
ID0	Dedicated MIC PCM In Channel	0
ID1	Modem Line Codec Support	0
ID2	Bass and Treble Control	0
ID3	Simulated Stereo (Mono to Stereo)	0
ID4	Headphone Out Support	1
ID5	Loudness (Bass Boost) Support	0
ID6	18-Bit DAC Resolution	0
ID7	20-Bit DAC Resolution	0
ID8	18-Bit ADC Resolution	0
ID9	20-Bit ADC Resolution	0

*The AD1881 contains none of the optional features identified by these bits.

SE[4:0] Stereo Enhancement. The 3D stereo enhancement identifies the Analog Devices 3D stereo enhancement.

Master Volume Registers (Index 02h)

Reg Num	Name	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default

PCV[3:0] PC Beep Volume Control. The least significant bit represents 3 dB attenuation. This register controls the output from 0 dB to a maximum attenuation of –45 dB. The PC Beep is routed to Left and Right Line outputs even when the **RESET** pin is asserted. This is so that Power on Self-Test (POST) codes can be heard by the user in case of a hardware problem with the PC.

PCM PC Beep Mute. When this bit is set to “1,” the channel is muted.

Subsection Ready Register (Index 26h)

Reg Num	Name	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
26h	Power-Down Cntrl/Stat	EAPD	X	PR5	PR4	PR3	PR2	PR1	PR0	X	X	X	X	REF	ANL	DAC	ADC	N/A

Note: The ready bits are read only, writing to REF, ANL, DAC, ADC will have no effect. These bits indicate the status for the AD1881 subsections. If the bit is a one, then that subsection is “ready.” Ready is defined as the subsection able to perform in its nominal state.

ADC ADC section ready to transmit data.

DAC DAC section ready to accept data.

ANL Analog gainuators, attenuators, and mixers ready.

REF Voltage References, VREF and VREFOUT up to nominal level.

PR[5:0] AD1881 Power-Down Modes. The first three bits are to be used individually rather than in combination with each other. The last bit PR3 can be used in combination with PR2 or by itself. The mixer and reference cannot be powered down via PR3 unless the ADCs and DACs are also powered down. Nothing else can be powered up until the reference is up.

PR5 has no effect unless all ADCs, DACs, and the AC-Link are powered down. The reference and the mixer can be either up or down, but all power-up sequences must be allowed to run to completion before PR5 and PR4 are both set.

In multiple-codec systems, the master codec’s PR5 and PR4 bits control the slave codec. PR5 is also effective in the slave codec if the master’s PR5 bit is clear, but the PR4 bit has no effect except to enable or disable PR5.

EAPD External Audio Amp Power Down. Available when programmed as an AC '97 codec.
 0 = Pin 47 set to LO state (default).
 1 = Pin 47 set to HI state.

Note: The Extended Audio Status and Control Register is a read/write register that provides status and control of the extended audio features.

VRA Variable Rate Audio. VRA = 1 enables Variable Rate Audio mode (sample rate control registers and SLOTREQ signaling).

PCM DAC Rate Register (Index 2Ch)

Reg Num	Name	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default

Note: 2Ch is an alias for 7Ah. The VRA bit in register 2Ah must be set for the alias to work; if a zero is written to VRA, both sample rates are reset to 48k.

SR[15:0] Writing to this register allows programming of the sampling frequency from 7 kHz (1B58h) to 48 kHz (BB80h) in 1 Hz increments. Programming a value outside of the range 7040 Hz (1b80h) to 48000 Hz (bb80h) causes the codec to saturate to 48 kHz if a rate greater than 48 kHz is programmed or to 7 kHz if a rate less than 7 kHz is programmed. For all rates, if the value written to the register is supported, that value will be echoed back when read, otherwise the closest rate supported is returned.

PCM ADC Rate Register (Index 32h)

Reg Num	Name	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default

Note: 32h is an alias for 78h. The VRA bit in register 2Ah must be set for the alias to work; if a zero is written to VRA, both sample rates are reset to 48k.

SR[15:0] Writing to this register allows programming of the sampling frequency from 7 kHz (1B58h) to 48 kHz (BB80h) in 1 Hz increments. Programming a value outside of the range 7040 Hz (1b80h) to 48000 Hz (bb80h) causes the codec to saturate to 48 kHz if a rate greater than 48 kHz is programmed, or to 7 kHz if a rate less than 7 kHz is programmed. For all rates, if the value written to the register is supported, that value will be echoed back when read, otherwise the closest rate supported is returned.

Serial Configuration (Index 74h)

74h	Serial Configuration	SLOT 16	REGM2	REGM1	REGM0	DRQEN	DLRQ2	DLRQ1	DLRQ0	X	X	X	X	X	DRRQ2	DRRQ1	DRRQ0	X

Note: This register is not reset when the reset register (register 00h) is written.

DRRQ0 Master Codec DAC right request.
 DRRQ1 Slave 1 Codec DAC right request.
 DRRQ2 Slave 2 Codec DAC right request.
 DLRQ0 Master Codec DAC left request.
 DLRQ1 Slave 1 Codec DAC left request.
 DLRQ2 Slave 2 Codec DAC left request.
 DRQEN Enable DAC request bits in status address and data slot.
 REGM0 Master Codec register mask.
 REGM1 Slave 1 Codec register mask.
 REGM2 Slave 2 Codec register mask.
 SLOT16 Enable 16-bit slots.

DRQEN and DxRQx are retained only for compatibility with the AD1819. New controller designs should use the VRA bit in register 2Ah and the request bits in the status address slot instead.

If your system uses only a single AD1881, you can ignore the register mask and the slave 1/slave 2 request bits. If you write to this register, write ones to all of the register mask bits. The DxRQx bits are read-only.

The Codec asserts the DxRQx bit when the corresponding DAC channel can accept data in the next frame. These bits are snapshots of the Codec state taken when the current frame began (effectively, on the rising edge of SYNC), but they also take notice of DAC samples sent in the current frame.

If you set the DRQEN bit, the AD1881 will fill all; otherwise, unused AC Link status address and data slots with the contents of register 74h. That makes it somewhat simpler to access the information because you don't need to continually issue AC Link read commands to obtain the register contents.

Also, the DAC requests are reflected in Slot 1, bits (11 . . . 6).

SLOT16 makes all AC Link slots 16 bits in length, formatted into 16 slots.

T[7:0] This register is ASCII encoded to “S.”

REV[7:0] Revision Register field contains the revision number.

These bits are read-only and should be verified before accessing vendor defined features.

AD1819/AD1819A/AD1881 USER-VISIBLE DIFFERENCES

- Supports 3.3 V digital VDD (as well as 5 V).

Register Differences

- Reserved register bits always yield zero when read.
- Writes to odd registers have no effect, instead of writing preceding even register. Reads of odd registers always return zero instead of value of preceding even register.
- Writing ones to bits 5 or 13 of register 02h no longer forces bits 4:0 or 12:8 to ones.
- Registers 04h and 08h are now reserved.
- It is no longer required that the mixer not be powered down in order to power up the DACs, and the mixer can be powered down without also powering down the DACs.
- Aliases 2Ch (7Ah) and 32h (78h) have been added with AC '97 2.0 behavior.
- Registers 28h and 2Ah have been added; writing a zero to the LSB of register 2Ah resets registers 2Ch (7Ah) and 32h (78h).
- Register 76h default value is 0404h instead of 0000h; DAM, DMS and LPMIX bits have been added.
- LSB of register 7Eh is 40h instead of 00h–03h.

Analog Differences

- CD to LINE_OUT path noninverting instead of inverting.
- Mixer feed through when powered off eliminated.

APPLICATIONS CIRCUITS

The AD1881 has been designed to require a minimum amount of external circuitry. The recommended applications circuits are shown in Figures 9 and 10. Reference designs for the AD1881 are available and may be obtained by contacting your local Analog Devices' sales representative or authorized distributor. Example shell programs for establishing a communications path between the AD1881 and an ADSP-21xx are also available.
