

GS2974B HD-LINX™ III Adaptive Cable Equalizer

Features

- SMPTE 424M, SMPTE 292M, 344M and SMPTE 259M compliant
- Automatic cable equalization
- Multi-standard operation from 143Mb/s to 2.97Gb/s
- Supports DVB-ASI at 270Mb/s
- Small footprint (4mm x 4mm)
- Pb-free and RoHS compliant
- Manual bypass (useful for low data rates with slow rise/fall times)
- Performance optimized for 1.485Gb/s and 2.97Gb/s
- Typical equalized length of Belden 1694A cable: 140m at 2.97Gb/s, 230m at 1.485Gb/s, and 250m at 270Mb/s
- 50Ω differential output (internal 50Ω pull-ups)
- Programmable mute based on max cable length adjust
- Single 3.3V power supply operation
- Operating temperature range: 0°C to +70°C
- Footprint compatible with GS2974A and GS1574A

Applications

- SMPTE 424M, SMPTE 292M and SMPTE 259M Coaxial Cable Serial Digital Interfaces.

Description

The GS2974B is a high-speed BiCMOS integrated circuit designed to equalize and restore signals received over 75Ω co-axial cable.

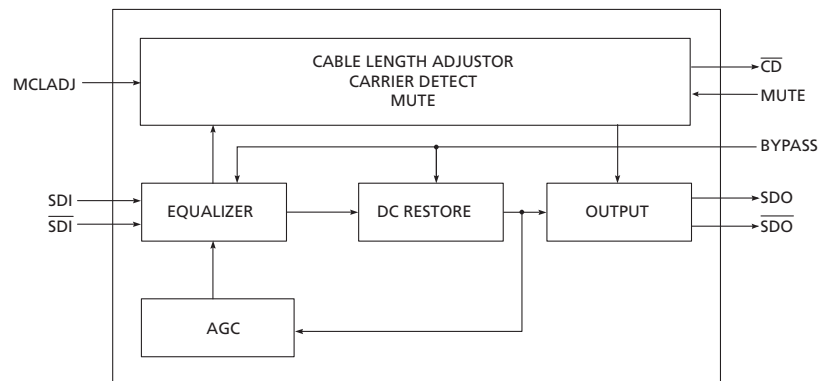

The GS2974B is designed to support SMPTE 424M, SMPTE 292M and SMPTE 259M, and is optimized for performance at 1.485Gb/s and 2.97Gb/s.

The GS2974B features DC restoration to compensate for the DC content of SMPTE pathological test patterns.

A voltage programmable mute threshold (MCLADJ), applicable for SD mode (refer to [Section 4.3](#)), is included to allow muting of the GS2974B output when an approximate selected cable length is reached for SMPTE 259M signals. This feature allows the GS2974B to distinguish between low amplitude SD-SDI signals and noise at the input of the device. The serial digital outputs of the GS2974B may be forced to a mute state by applying a voltage to the MUTE pin.

Power consumption is typically 215mW using a 3.3V power supply. The GS2974B is lead-free, and the encapsulation compound does not contain halogenated flame retardant.

This component and all homogeneous subcomponents are RoHS compliant.

GS2974B Functional Block Diagram

Revision History

Version	ECR	PCN	Date	Changes and/or Modifications
3	151788	–	April 2009	Corrected 250pc part number in 6.6 Ordering Information.
2	151333	–	January 2009	Added 2500pc reel size to 6.6 Ordering Information. Added the maximum power consumption in Table 2-1: DC Electrical Characteristics. Changed the Output Voltage Swing from 550mV _{p-p} to 600mV _{p-p} in Table 2-2: AC Electrical Characteristics.
1	149533	–	April 2008	Converted to Data Sheet. Updated document format. Re-wrote section 4.3 Programmable Maximum Cable Length Adjust (MCLADJ). Added Tape and Reel to 6.6 Ordering Information.
0	148227	–	November 2007	Converted to Preliminary Data Sheet. Changed Input ESD Voltage to 4kV in 2.1 Absolute Maximum Ratings. Replaced 5.3 Typical Application Circuit.
B	146732	–	August 2007	Addition of High Gain Adaptive Cable Equalizers on page 12, and removal of Typical Application Circuit on page 13.
A	145689	–	July 2007	New document.

4. Detailed Description

The GS2974B is a high speed BiCMOS IC designed to equalize serial digital signals.

The GS2974B can equalize 3Gb/s, HD and SD serial digital signals, and will typically equalize 140m of Belden 1694A cable at 2.97Gb/s, 230m at 1.485Gb/s and 250m at 270Mb/s. The GS2974B is powered from a single +3.3V power supply and consumes approximately 215mW of power.

4.1 Serial Digital Inputs

The Serial Data Signal may be connected to the input pins (SDI/ \overline{SDI}) in either a differential or single ended configuration. AC coupling of the inputs is recommended, as the SDI and \overline{SDI} inputs are internally biased at approximately 1.8V.

4.2 Cable Equalization

The input signal passes through a variable gain equalizing stage whose frequency response closely matches the inverse of the cable loss characteristic. In addition, the variation of the frequency response with control voltage imitates the variation of the inverse cable loss characteristic with cable length.

The edge energy of the equalized signal is monitored by a detector circuit which produces an error signal corresponding to the difference between the desired edge energy and the actual edge energy. This error signal is integrated by both an internal and an external AGC filter capacitor providing a steady control voltage for the gain stage. As the frequency response of the gain stage is automatically varied by the application of negative feedback, the edge energy of the equalized signal is kept at a constant level which is representative of the original edge energy at the transmitter. The equalized signal is also DC restored, effectively restoring the logic threshold of the equalized signal to its correct level independent of shifts due to AC coupling. The digital output signals have a nominal voltage of 750mV_{pp} differential, or 375mV_{pp} single ended when terminated with 50Ω as shown in Figure 4-1.

Figure 4-1: Typical Output Voltage Levels

4.3 Programmable Maximum Cable Length Adjust (MCLADJ)

For SMPTE 259M inputs, the GS2974B incorporates a programmable Maximum Cable Length Adjust (MCLADJ) threshold.

This feature can be useful in applications where there are multiple input channels using the GS2974B and the maximum gain can be limited to avoid crosstalk.

The MCLADJ pin acts to change the threshold of the Carrier Detect ($\overline{\text{CD}}$) pin. When the input signal drops below a certain threshold, the $\overline{\text{CD}}$ pin will be driven high, indicating that there is not a valid input signal. In order to enable automatic muting of the output of the GS2974B, the $\overline{\text{CD}}$ pin should be connected directly to the MUTE pin. In applications where programmable maximum cable length adjust is not required, the MCLADJ pin may be left unconnected.

This feature has been designed for use in applications such as routers, where signal crosstalk and circuit noise cause the Equalizer to output erroneous data when no input signal is present. The use of a Carrier Detect function with a fixed internal reference

does not solve this problem, since the signal to noise ratio on the circuit board could be significantly less than the default signal detection level set by the on chip reference.

NOTE: MCLADJ is only recommended for data rates up to 360Mb/s. For data rates above this, MCLADJ should be left floating.

4.4 Mute and Carrier Detect

The GS2974B includes a MUTE input pin that allows the application interface to mute the Serial Digital Output at any time. Set the MUTE pin HIGH to mute SDO and $\overline{\text{SDO}}$. In this case, the outputs will mute regardless of the setting of the BYPASS pin.

A Carrier Detect output pin ($\overline{\text{CD}}$) indicates the presence of a valid signal at the input of the GS2974B. When $\overline{\text{CD}}$ is LOW, the device has detected a valid input on SDI and $\overline{\text{SDI}}$. When $\overline{\text{CD}}$ is HIGH, the device has not detected a valid input.

NOTE 1: $\overline{\text{CD}}$ will only detect loss of carrier for data rates greater than 19Mb/s. The $\overline{\text{CD}}$ output pin may be connected directly to the MUTE input pin to enable automatic muting of the GS2974B when no valid input signal has been detected.

NOTE 2: If the maximum cable length is exceeded (set by the MCLADJ pin) and the device is not in Bypass mode, the $\overline{\text{CD}}$ pin will not be driven low, even if a carrier is present.

Table 4-1: Mute Input Table

Mute	Function
0	SDO and $\overline{\text{SDO}}$ operate normally
1	SDO and $\overline{\text{SDO}}$ are forced to a steady state

Table 4-2: $\overline{\text{CD}}$ Output Table

$\overline{\text{CD}}$	Input Status
0	Valid Input on SDI, $\overline{\text{SDI}}$ pins
1	Input is not valid

5. Application Information

5.1 High Gain Adaptive Cable Equalizers

The GS2974B is Gennum's latest multi-rate Adaptive Cable Equalizer. In order to continue to extend the cable length that an equalizer will remain operational over, it is necessary to increase the gain of the Equalizer.

A Video Cable Equalizer must provide wide band gain over a range of frequencies in order to accommodate the range of data rates and signal patterns that are present in a SMPTE compliant serial video stream.

The GS2974B has an increase in gain over the GS2974A at critical HD and 3Gbps frequencies, and because of this the GS2974B will be sensitive to signals at the input that the GS2974A will not be sensitive to.

Small levels of signal or noise present at the input pins of the Equalizer may cause chatter at the output. In order to prevent this from happening, particular attention must be paid to board layout.

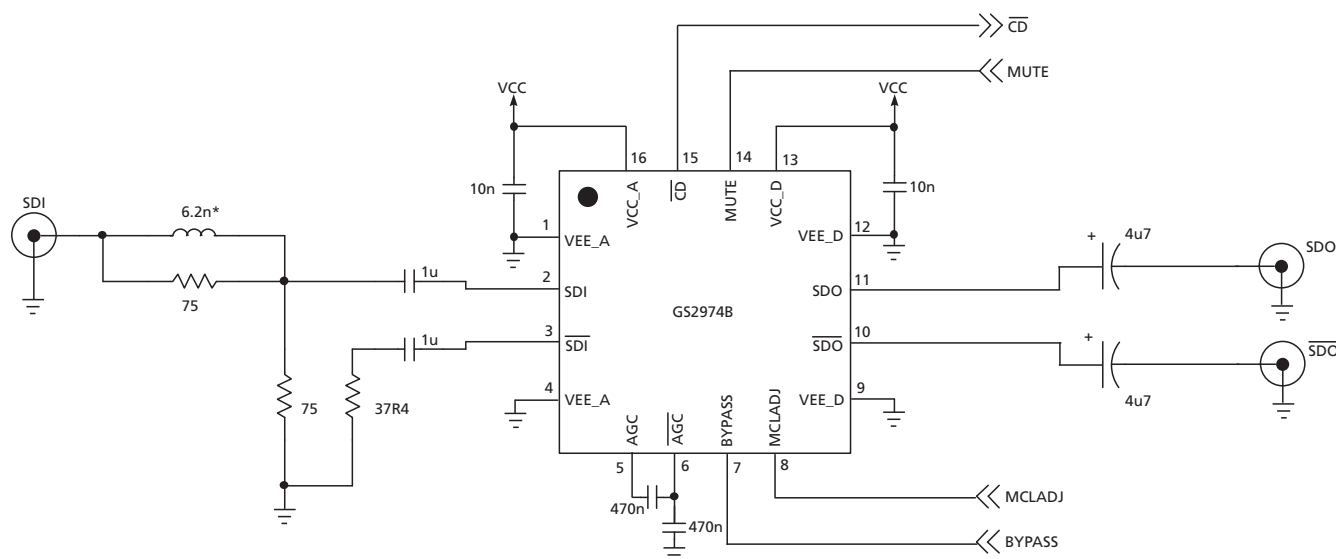

Because the level and frequency of noise present in every system varies, please contact Gennum at vbapps@gennum.com to get the most current recommendations.

5.2 PCB Layout

Special attention must be paid to component layout when designing Serial Digital Interfaces for HDTV. An FR-4 dielectric can be used, however, controlled impedance transmission lines are required for PCB traces longer than approximately 1cm. Note the following PCB artwork features used to optimize performance:

- PCB trace width for HD rate signals is closely matched to SMT component width to minimize reflections due to change in trace impedance.
- The PCB ground plane is removed under the GS2974B input components to minimize parasitic capacitance.
- The PCB ground plane is removed under the GS2974B output components to minimize parasitic capacitance.
- High speed traces are curved to minimize impedance changes.

5.3 Typical Application Circuit

NOTE: All resistors in Ohms, capacitors in Farads, and inductors in Henrys, unless otherwise noted.
* Value dependent on layout

Figure 5-1: GS2974B Typical Application Circuit

6.3 Recommended PCB Footprint

The Center Pad should be connected to the most negative power supply plane for analog circuitry in the device (VEE_A) by a minimum of 5 vias.

NOTE: Suggested dimensions only. Final dimensions should conform to customer design rules and process optimizations.

6.4 Marking Diagram

Pin 1 ID

XXXX - Lot/Work Order ID

YYWW - Date Code

YY - 2-digit year

WW - 2-digit week number

6.5 Solder Reflow Profiles

The device is manufactured with Matte-Sn terminations and is compatible with both standard eutectic and Pb-free solder reflow profiles. MSL qualification was performed using the maximum Pb-free reflow profile shown in Figure 6-1. The recommended standard Pb reflow profile is shown in Figure 6-2.

Figure 6-1: Maximum Pb-free Solder Reflow Profile (Preferred)

Figure 6-2: Standard Pb Solder Reflow Profile
