

NTE744 Integrated Circuit RF/IF Amp

Description:

The NTE744 is a monolithic silicon integrated circuit that provides an rf amplifier, if amplifier, mixer, oscillator, AGC detector, and voltage regulator on a single chip. It is intended for use in super-heterodyne AM radio receiver applications particularly in automobiles. The NTE744 is supplied in a 14-lead dual-in-line plastic package and operates over the temperature range of -55° to 125°C .

Features:

- Low-noise, low- R_b , rf stage in cascode connection—eliminates Miller-Effect regeneration and allows controlled power rise by the choice of external components.
- Mixer-oscillator stage with internal feedback—eliminates need for tapped or multi-winding oscillator coils
- Cascode if amplifier with controlled output impedance and negligible Miller Effect—eliminates regeneration and selectivity skewing
- Frequency-counter AGC circuit—allows control of AGC response by selection of the coupling capacitor.
- Integral regulation with built-in surge protection
- Separately accessible amplifiers
