

Spec No.: DS30-2008-0178 Effective Date: 02/09/2010

Revision: A

LITE-ON DCC

RELEASE

BNS-OD-FC001/A4

Property of Lite-On Only

FEATURES

- *RECTANGULAR LIGHT BAR
- *WIDE SUPPLY VOLTAGE OPERATION
- *SERIAL DATA INPUT.
- *CONSTANT CURRENT DRIVERS.
- *CONTINUOUS BRIGHTNESS CONTROL.
- *OUTPUT AVAILABLE FOR TWO EXTERNAL LEDS.
- *WIDE VIEWING ANGLE.
- *TTL COMPATIBLE.
- *LEAD-FREE PACKAGE(ACCORDING TO ROHS)

DESCRIPTION

The LT-KVA00052 is a display consists of two side-by-side 17-element bar graph. It has a built-in M5450 MOS IC that contains serial data input and 35 bit shift control. The MOS IC produced with N-channel silicon gate technology. This device uses Red orange and Green LED chips (GaAsP epi on GaP substrate), and has a gray face and white segments.

ABSOLUTE MAXIMUM RATING AT TA=25°C

PARAMETER	SYMBOL	MIN.	MAX.	UNIT			
Supply Voltage	V_{DD}	-0.3	12	V			
Input Voltage	VI	-0.3	12	V			
Off State Output Voltage	Vo(off)		12	V			
LED Supply Voltage	VLED	2.8	3.5	V			
Power Dissipation of IC	P _D (IC)		335	mW			
Supply Current	Idd		8.5	mA			
Operating Temperature Range	Тор	-20	+60	°C			
Storage Temperature Range	Tstg	-20	+60	°C			

| Solder Temperature: 1/16 inch Below Seating Plane for 3 Seconds at 260°C

NOTE:1.All Voltages are with respect to Vss(GND).

- 2. Power dissipation of IC is given by P_D = (V_{LED} V_F) (IF) (NO. of Segments)
 - $+(8.5\text{mA}) \cdot (V_{DD})$
 - * VF is LED forward voltage.

FUNCTIONAL DESCRIPTION

Serial data transfer from the data source to the display driver is accomplished with 2 signals serial data and clock. Using a format of a leading "1" following by the 35 data bits allows data transfer without an additional load signal. The 35 data bits are latched after the 36th bit is completed, thus providing non-multiplexed, direct drive to the display. Outputs change only if the serial data bits differ from the previous time.

Brightness of display is determined by control the Output current of LED display. A 1nF capacitor should be connected to brightness control, Pin 7 to prevent possible oscillations. The output current is typically 25 times greater than the current into Pin 7 which is set by an external variable resistor. There is an internal limiting resistor of 400Ω nominal value.

Figure 1 shows the input data format. A start bit of logical "1" proceed the 35 bits of data. At the 36th clock, a LOAD signal is generated synchronously with the high state of the clock, which loads the 35 bits of the shift registers into the latches. At the low state of the clock a RESET signal is generated which clears all the shift registers for the next set of data. The shift registers are static master-slave configuration. There is no clear for portion of the first register, thus allowing continuous operation.

There must be a complete set of 36 clocks or the shift registers won't clear. When power is first applied to the chip an internal power ON reset signal is generated which reset all registers and all latched. The ATART bit and first clock return the chip on its normal operation. Bit 1 is the first following the start bit and it will appear on the Figure 2 shows the timing relationship between data clock, and DATA ENABLE. A maximum clock frequency of 0.5 MHz is assumed.
